## Typographic Conventions

---

`name; fname; gname; mname; sname; v*name*; cname`

▷ Symbol defined in Common Lisp; esp. function, generic function, macro, special operator, variable, constant.

`them` ▷ Placeholder for actual code.

`me` ▷ Literal text.

`[foo|bar]` ▷ Either one *foo* or nothing; defaults to *bar*.

`foo*; {foo}*` ▷ Zero or more *foos*.

`foo+; {foo}+` ▷ One or more *foos*.

`foos` ▷ English plural denotes a list argument.

`{foo|bar|baz}; {  
  foo  
  bar  
  baz}` ▷ Either *foo*, or *bar*, or *baz*.

`{  
  foo  
  bar  
  baz}` ▷ Anything from none to each of *foo*, *bar*, and *baz*.

`^foo` ▷ Argument *foo* is not evaluated.

`~bar` ▷ Argument *bar* is possibly modified.

`fooP*` ▷ *foo\** is evaluated as in `sprogn`; see page 20.

`foo; bar; baz` ▷ Primary, secondary, and *n*th return value.

`T; NIL` ▷ `t`, or truth in general; and `nil` or `()`.

# 1 Numbers

---

## 1.1 Predicates

---

$(f= \text{number}^+)$

$(f\neq \text{number}^+)$

▷  $\underline{T}$  if all *numbers*, or none, respectively, are equal in value.

$(f> \text{number}^+)$

$(f\geq \text{number}^+)$

$(f< \text{number}^+)$

$(f\leq \text{number}^+)$

▷ Return  $\underline{T}$  if *numbers* are monotonically decreasing, monotonically non-increasing, monotonically increasing, or monotonically non-decreasing, respectively.

$(f\text{minusp } a)$

$(f\text{zerop } a)$

$(f\text{plusp } a)$

▷  $\underline{T}$  if  $a < 0$ ,  $a = 0$ , or  $a > 0$ , respectively.

$(f\text{evenp } int)$

$(f\text{oddp } int)$

▷  $\underline{T}$  if *int* is even or odd, respectively.

$(f\text{numberp } foo)$

$(f\text{realp } foo)$

$(f\text{rationalp } foo)$

$(f\text{floatp } foo)$

▷  $\underline{T}$  if *foo* is of indicated type.

$(f\text{integerp } foo)$

$(f\text{complexp } foo)$

$(f\text{random-state-p } foo)$

## 1.2 Numeric Functions

---

$(f+ a_{\square}^*)$

$(f* a_{\square}^*)$

▷ Return  $\sum a$  or  $\prod a$ , respectively.

$(f- a b^*)$

$(f/ a b^*)$

▷ Return  $\underline{a - \sum b}$  or  $\underline{a / \prod b}$ , respectively. Without any *bs*, return  $\underline{-a}$  or  $\underline{1/a}$ , respectively.

$(f\mathbf{1+} a)$

$(f\mathbf{1-} a)$

▷ Return  $\underline{a + 1}$  or  $\underline{a - 1}$ , respectively.

$(\begin{cases} f\text{incf} \\ f\text{decf} \end{cases}) \widetilde{\text{place}} [delta_{\square}]$

▷ Increment or decrement the value of *place* by *delta*. Return new value.

$(f\text{exp } p)$

$(f\text{expt } b p)$

▷ Return  $e^p$  or  $b^p$ , respectively.

$(f\log a [b_{\square}])$

▷ Return  $\underline{\log_b a}$  or, without *b*,  $\underline{\ln a}$ .

$(f\text{sqrt } n)$

$(f\text{isqrt } n)$

▷  $\underline{\sqrt{n}}$  in complex numbers/natural numbers.

$(f\text{lcm integer}^*_{\square})$

$(f\text{gcd integer}^*)$

▷ Least common multiple or greatest common denominator, respectively, of *integers*. ( $\text{gcd}$ ) returns  $\underline{0}$ .

$c\pi$

▷ **long-float** approximation of  $\pi$ , Ludolph's number.

$(f\sin a)$

$(f\cos a)$

▷  $\underline{\sin a}$ ,  $\underline{\cos a}$ , or  $\underline{\tan a}$ , respectively. (*a* in radians.)

$(f\tan a)$

$(f\text{asin } a)$

$(f\text{acos } a)$

▷  $\underline{\arcsin a}$  or  $\underline{\arccos a}$ , respectively, in radians.

$(f\text{atan } a [b_{\square}])$

▷  $\underline{\arctan \frac{a}{b}}$  in radians.

$(f\text{sinh } a)$

$(f\text{cosh } a)$

▷  $\underline{\sinh a}$ ,  $\underline{\cosh a}$ , or  $\underline{\tanh a}$ , respectively.

$(f\text{tanh } a)$

<code>(fasinh a)</code>	
<code>(facosh a)</code>	▷ <u>asinh a</u> , <u>acosh a</u> , or <u>atanh a</u> , respectively.
<code>(fatanh a)</code>	
<code>(fcis a)</code>	▷ Return $e^{ia} = \cos a + i \sin a$ .
<code>(fconjugate a)</code>	▷ Return complex <u>conjugate</u> of <u>a</u> .
<code>(fmax num+)</code>	▷ <u>Greatest</u> or <u>least</u> , respectively, of <u>nums</u> .
<code>(fmin num+)</code>	
<code>({fround fround}{ {ffloor ffloor}{ {fceiling fceiling}{ {ftruncate ftruncate}}}) n [d<sub>11</sub>])</code>	▷ Return as <u>integer</u> or <u>float</u> , respectively, $\frac{n}{d}$ rounded, or rounded towards $-\infty$ , $+\infty$ , or 0, respectively; and <u>remainder</u> .
<code>({fmod}{ {frem}} n d)</code>	▷ Same as <u>ffloor</u> or <u>ftruncate</u> , respectively, but return <u>remainder</u> only.
<code>(random limit [state<sub>*random-state*</sub>])</code>	▷ Return non-negative <u>random number</u> less than <u>limit</u> , and of the same type.
<code>(make-random-state [{state NIL T}<sub>NIL</sub>])</code>	▷ <u>Copy</u> of <u>random-state</u> object <u>state</u> or of the current random state; or a randomly initialized fresh <u>random state</u> .
<code>*random-state*</code>	▷ Current random state.
<code>(float-sign num-a [num-b<sub>11</sub>])</code>	▷ <u>num-b</u> with <u>num-a</u> 's sign.
<code>(signum n)</code>	▷ <u>Number</u> of magnitude 1 representing sign or phase of <u>n</u> .
<code>(numerator rational)</code>	
<code>(denominator rational)</code>	▷ Numerator or denominator, respectively, of <u>rational</u> 's canonical form.
<code>(realpart number)</code>	
<code>(imagpart number)</code>	▷ Real part or imaginary part, respectively, of <u>number</u> .
<code>(complex real [imag<sub>11</sub>])</code>	▷ Make a <u>complex number</u> .
<code>(phase num)</code>	▷ Angle of <u>num</u> 's polar representation.
<code>(abs n)</code>	▷ Return <u> n </u> .
<code>(rational real)</code>	
<code>(rationalize real)</code>	▷ Convert <u>real</u> to <u>rational</u> . Assume complete/limited accuracy for <u>real</u> .
<code>(float real [prototype<sub>0.0F0</sub>])</code>	▷ Convert <u>real</u> into <u>float</u> with type of <u>prototype</u> .

### 1.3 Logic Functions

---

Negative integers are used in two's complement representation.

<code>(BOOLE operation int-a int-b)</code>	
	▷ Return <u>value</u> of bitwise logical <u>operation</u> . <u>operations</u> are
<code>cBOOLE-1</code>	▷ <u>int-a</u> .
<code>cBOOLE-2</code>	▷ <u>int-b</u> .
<code>cBOOLE-C1</code>	▷ <u>¬int-a</u> .
<code>cBOOLE-C2</code>	▷ <u>¬int-b</u> .
<code>cBOOLE-SET</code>	▷ All bits set.
<code>cBOOLE-CLR</code>	▷ All bits zero.

<code>cboole-eqv</code>	▷ $\underline{\text{int-}a \equiv \text{int-}b}$ .
<code>cboole-and</code>	▷ $\underline{\text{int-}a \wedge \text{int-}b}$ .
<code>cboole-andc1</code>	▷ $\underline{\neg \text{int-}a \wedge \text{int-}b}$ .
<code>cboole-andc2</code>	▷ $\underline{\text{int-}a \wedge \neg \text{int-}b}$ .
<code>cboole-nand</code>	▷ $\underline{\neg(\text{int-}a \wedge \text{int-}b)}$ .
<code>cboole-ior</code>	▷ $\underline{\text{int-}a \vee \text{int-}b}$ .
<code>cboole-orc1</code>	▷ $\underline{\neg \text{int-}a \vee \text{int-}b}$ .
<code>cboole-orc2</code>	▷ $\underline{\text{int-}a \vee \neg \text{int-}b}$ .
<code>cboole-xor</code>	▷ $\underline{\neg(\text{int-}a \equiv \text{int-}b)}$ .
<code>cboole-nor</code>	▷ $\underline{\neg(\text{int-}a \vee \text{int-}b)}$ .
<code>(flognot integer)</code>	▷ $\underline{\neg \text{integer}}$ .
<code>(flogeqv integer*)</code>	
<code>(flogand integer*)</code>	
	▷ Return <u>value of exclusive-nored or anded integers</u> , respectively. Without any <i>integer</i> , return <u>-1</u> .
<code>(flogandc1 int-a int-b)</code>	▷ $\underline{\neg \text{int-}a \wedge \text{int-}b}$ .
<code>(flogandc2 int-a int-b)</code>	▷ $\underline{\text{int-}a \wedge \neg \text{int-}b}$ .
<code>(flogand int-a int-b)</code>	▷ $\underline{\neg(\text{int-}a \wedge \text{int-}b)}$ .
<code>(flogxor integer*)</code>	
<code>(flogior integer*)</code>	
	▷ Return <u>value of exclusive-ored or ored integers</u> , respectively. Without any <i>integer</i> , return <u>0</u> .
<code>(flogorc1 int-a int-b)</code>	▷ $\underline{\neg \text{int-}a \vee \text{int-}b}$ .
<code>(flogorc2 int-a int-b)</code>	▷ $\underline{\text{int-}a \vee \neg \text{int-}b}$ .
<code>(flognor int-a int-b)</code>	▷ $\underline{\neg(\text{int-}a \vee \text{int-}b)}$ .
<code>(flogbitp i int)</code>	▷ <u>T</u> if zero-indexed <i>i</i> th bit of <i>int</i> is set.
<code>(flogtest int-a int-b)</code>	
	▷ Return <u>T</u> if there is any bit set in <i>int-a</i> which is set in <i>int-b</i> as well.
<code>(flogcount int)</code>	
	▷ <u>Number of 1 bits in <i>int</i> <math>\geq 0</math>, number of 0 bits in <i>int</i> <math>&lt; 0</math></u> .

## 1.4 Integer Functions

---

<code>(finteger-length integer)</code>	▷ <u>Number of bits</u> necessary to represent <i>integer</i> .
<code>(fldb-test byte-spec integer)</code>	▷ Return <u>T</u> if any bit specified by <i>byte-spec</i> in <i>integer</i> is set.
<code>(fash integer count)</code>	▷ Return copy of <i>integer</i> arithmetically shifted left by <i>count</i> adding zeros at the right, or, for <i>count</i> $< 0$ , shifted right discarding bits.
<code>(fdb byte-spec integer)</code>	▷ Extract <u>byte</u> denoted by <i>byte-spec</i> from <i>integer</i> . <b>settable</b> .
<code>(fdeposit-field {fdb} int-a byte-spec int-b)</code>	▷ Return <i>int-b</i> with bits denoted by <i>byte-spec</i> replaced by corresponding bits of <i>int-a</i> , or by the low ( <code>(fbyte-size</code> <i>byte-spec</i> ) bits of <i>int-a</i> , respectively.
<code>(fmask-field byte-spec integer)</code>	▷ Return copy of <i>integer</i> with all bits unset but those denoted by <i>byte-spec</i> . <b>settable</b> .
<code>(fbyte size position)</code>	▷ <u>Byte specifier</u> for a byte of <i>size</i> bits starting at a weight of $2^{position}$ .
<code>(fbyte-size byte-spec)</code>	
<code>(fbyte-position byte-spec)</code>	
	▷ <u>Size</u> or <u>position</u> , respectively, of <i>byte-spec</i> .

## 1.5 Implementation-Dependent

---

`cshort-float`  
`csingle-float`  
`cdouble-float`  
`clong-float`

▷ Smallest possible number making a difference when added or subtracted, respectively.

`cleast-negative`  
`cleast-negative-normalized`  
`cleast-positive`  
`cleast-positive-normalized`

`short-float`  
`single-float`  
`double-float`  
`long-float`

▷ Available numbers closest to  $-0$  or  $+0$ , respectively.

`cmost-negative`  
`cmost-positive`

`short-float`  
`single-float`  
`double-float`  
`long-float`  
`fixnum`

▷ Available numbers closest to  $-\infty$  or  $+\infty$ , respectively.

`(fdecode-float n)`  
`(finteger-decode-float n)`

▷ Return significand, exponent, and sign of **float**  $n$ .

`(fscale-float n i)`    ▷ With  $n$ 's radix  $b$ , return  $nb^i$ .

`(ffloat-radix n)`

`(ffloat-digits n)`

`(ffloat-precision n)`

▷ Radix, number of digits in that radix, or precision in that radix, respectively, of float  $n$ .

`(fupgraded-complex-part-type foo [environment NIL])`

▷ Type of most specialized **complex** number able to hold parts of type  $foo$ .

## 2 Characters

---

The **standard-char** type comprises a-z, A-Z, 0-9, Newline, Space, and !? \$"'`.:;,;\*+-|\\~\_`<=>#%@&() [] {}.

`(fcharacterp foo)`

`(fstandard-char-p char)`    ▷ T if argument is of indicated type.

`(fgraphic-char-p character)`

`(falpha-char-p character)`

`(falphabeticp character)`

▷ T if  $character$  is visible, alphabetic, or alphanumeric, respectively.

`(fupper-case-p character)`

`(flower-case-p character)`

`(fboth-case-p character)`

▷ Return T if  $character$  is uppercase, lowercase, or able to be in another case, respectively.

`(fdigit-char-p character [radix 10])`

▷ Return its weight if  $character$  is a digit, or NIL otherwise.

`(fchar= character+)`

`(fchar/= character+)`

▷ Return T if all  $characters$ , or none, respectively, are equal.

`(fchar-equal character+)`

`(fchar-not-equal character+)`

▷ Return T if all  $characters$ , or none, respectively, are equal ignoring case.

`(fchar> character+)`

`(fchar>= character+)`

`(fchar< character+)`

`(fchar<= character+)`

▷ Return T if  $characters$  are monotonically decreasing, monotonically non-increasing, monotonically increasing, or monotonically non-decreasing, respectively.

(*fchar-greaterp* *character*<sup>+</sup>)  
 (*fchar-not-lessp* *character*<sup>+</sup>)  
 (*fchar-lessp* *character*<sup>+</sup>)  
 (*fchar-not-greaterp* *character*<sup>+</sup>)

▷ Return T if *characters* are monotonically decreasing, monotonically non-increasing, monotonically increasing, or monotonically non-decreasing, respectively, ignoring case.

(*fchar-upcase* *character*)  
 (*fchar-downcase* *character*)

▷ Return corresponding uppercase/lowercase character, respectively.

(*fdigit-char* *i* [*radix*<sub>10</sub>]) ▷ Character representing digit *i*.

(*fchar-name* *char*) ▷ *char*'s name if any, or NIL.

(*fname-char* *foo*) ▷ Character named *foo* if any, or NIL.

(*fchar-int* *character*) ▷ Code of *character*.

(*fchar-code* *character*) ▷ Code of *character*.

(*fcode-char* *code*) ▷ Character with *code*.

*cchar-code-limit* ▷ Upper bound of (*fchar-code* *char*);  $\geq 96$ .

(*fcharacter* *c*) ▷ Return #\c.

### 3 Strings

Strings can as well be manipulated by array and sequence functions; see pages 10 and 12.

(*fstringp* *foo*)  
 (*fsimple-string-p* *foo*) ▷ T if *foo* is of indicated type.

( $\begin{cases} fstring= \\ fstring-equal \end{cases}$ ) *foo bar*  $\left\{ \begin{array}{l} :start1 start-foo_{\square} \\ :start2 start-bar_{\square} \\ :end1 end-foo_{NIL} \\ :end2 end-bar_{NIL} \end{array} \right\}$

▷ Return T if subsequences of *foo* and *bar* are equal. Obey/ignore, respectively, case.

( $\begin{cases} fstring{/= |not-equal} \\ fstring{> |greaterp} \\ fstring{>= |not-lessp} \\ fstring{< |lessp} \\ fstring{<= |not-greaterp} \end{cases}$ ) *foo bar*  $\left\{ \begin{array}{l} :start1 start-foo_{\square} \\ :start2 start-bar_{\square} \\ :end1 end-foo_{NIL} \\ :end2 end-bar_{NIL} \end{array} \right\}$

▷ If *foo* is lexicographically not equal, greater, not less, less, or not greater, respectively, then return position of first mismatching character in *foo*. Otherwise return NIL. Obey/ignore, respectively, case.

(*fmake-string* *size*  $\left\{ \begin{array}{l} :initial-element char \\ :element-type type_{character} \end{array} \right\}$ )  
 ▷ Return string of length *size*.

(*fstring* *x*)  
 ( $\begin{cases} fstring-capitalize \\ fstring-upcase \\ fstring-downcase \end{cases}$ ) *x*  $\left\{ \begin{array}{l} :start start_{\square} \\ :end end_{NIL} \end{array} \right\}$

▷ Convert *x* (**symbol**, **string**, or **character**) into a string, a string with capitalized words, an all-uppercase string, or an all-lowercase string, respectively.

( $\begin{cases} fnstring-capitalize \\ fnstring-upcase \\ fnstring-downcase \end{cases}$ ) *string*  $\left\{ \begin{array}{l} :start start_{\square} \\ :end end_{NIL} \end{array} \right\}$

▷ Convert *string* into a string with capitalized words, an all-uppercase string, or an all-lowercase string, respectively.

( $\begin{cases} fstring-trim \\ fstring-left-trim \\ fstring-right-trim \end{cases}$ ) *char-bag string*)

▷ Return string with all characters in sequence *char-bag* removed from both ends, from the beginning, or from the end, respectively.

(*fchar* *string i*)  
(*fschar* *string i*)  
▷ Return zero-indexed ith character of *string* ignoring/obeying, respectively, fill pointer. **setfable**.

(*fparse-integer* *string*  $\left\{ \begin{array}{l} \text{:start } start_{\boxed{0}} \\ \text{:end } end_{\boxed{\text{NIL}}} \\ \text{:radix } int_{\boxed{10}} \\ \text{:junk-allowed } bool_{\boxed{\text{NIL}}} \end{array} \right\}$ )  
▷ Return integer parsed from *string* and index of parse end.

## 4 Conses

---

### 4.1 Predicates

---

(*fconsp* *foo*) ▷ Return T if *foo* is of indicated type.  
(*flistp* *foo*) ▷ Return T if *list/foo* is NIL.  
(*fendp* *list*) ▷ Return T if *list/foo* is NIL.  
(*fnull* *foo*) ▷ Return T if *foo* is not a **cons**.  
(*fatomp* *foo list*) ▷ Return T if *foo* is a tail of *list*.  
(*fmember* *foo list*  $\left\{ \begin{array}{l} \left\{ \begin{array}{l} \text{:test } function_{\#eql} \\ \text{:test-not } function \end{array} \right\} \\ \text{:key } function \end{array} \right\}$ )  
▷ Return tail of list starting with its first element matching *foo*. Return NIL if there is no such element.  
( $\left\{ \begin{array}{l} \text{fmember-if} \\ \text{fmember-if-not} \end{array} \right\}$  *test list* [*:key function*])  
▷ Return tail of list starting with its first element satisfying *test*. Return NIL if there is no such element.  
(*fsubsetp* *list-a list-b*  $\left\{ \begin{array}{l} \left\{ \begin{array}{l} \text{:test } function_{\#eql} \\ \text{:test-not } function \end{array} \right\} \\ \text{:key } function \end{array} \right\}$ )  
▷ Return T if *list-a* is a subset of *list-b*.

### 4.2 Lists

---

(*fcons* *foo bar*) ▷ Return new cons (*foo . bar*).  
(*flist* *foo\**) ▷ Return list of foos.  
(*flist\** *foo<sup>+</sup>*)  
▷ Return list of foos with last *foo* becoming cdr of last cons.  
Return *foo* if only one *foo* given.  
(*make-list* *num* [*:initial-element foo<sub>NIL</sub>*])  
▷ New list with *num* elements set to *foo*.  
(*list-length* *list*) ▷ Length of *list*; NIL for circular *list*.  
(*fcar* *list*) ▷ Car of list or NIL if *list* is NIL. **setfable**.  
(*fcdr* *list*) ▷ Cdr of list or NIL if *list* is NIL. **setfable**.  
(*frest* *list*) ▷ Cdr of list or NIL if *list* is NIL. **setfable**.  
(*fnthcdr* *n list*) ▷ Return tail of list after calling *fcdr n* times.  
( $\left\{ \begin{array}{l} f\text{first} \\ f\text{second} \\ f\text{third} \\ f\text{fourth} \\ f\text{fifth} \\ f\text{sixth} \\ \dots \\ f\text{ninth} \\ f\text{tenth} \end{array} \right\}$  *list*)  
▷ Return *n*th element of list if any, or NIL otherwise. **setfable**.  
(*fnth* *n list*) ▷ Zero-indexed *n*th element of list. **setfable**.  
(*fcXr* *list*)  
▷ With *X* being one to four **as** and **ds** representing *fcars* and *fcdrs*, e.g. (*fcadr bar*) is equivalent to (*fcar* (*fcdr bar*)). **setfable**.  
(*flast* *list* [*num<sub>1</sub>*]) ▷ Return list of last num conses of list.

$(\begin{cases} f\text{butlast } list \\ f\text{nbutlast } list \end{cases}) [num]$ )  $\triangleright$  list excluding last num conses.

$(\begin{cases} frplaca \\ frplacd \end{cases}) cons$  object)

$\triangleright$  Replace car, or cdr, respectively, of cons with object.

$(f\text{idiff } list foo)$

$\triangleright$  If foo is a tail of list, return preceding part of list. Otherwise return list.

$(f\text{adjoin } foo list \left\{ \begin{array}{l} \{\text{:test function}\#'\text{eq}\} \\ \{\text{:test-not function}\} \\ \{\text{:key function}\} \end{array} \right\})$

$\triangleright$  Return list if foo is already member of list. If not, return  $(f\text{cons } foo list)$ .

$(m\text{pop } \widetilde{place})$

$\triangleright$  Set place to  $(f\text{cdr } place)$ , return  $(f\text{car } place)$ .

$(m\text{push } foo \widetilde{place}) \triangleright$  Set place to  $(f\text{cons } foo place)$ .

$(m\text{pushnew } foo \widetilde{place} \left\{ \begin{array}{l} \{\text{:test function}\#'\text{eq}\} \\ \{\text{:test-not function}\} \\ \{\text{:key function}\} \end{array} \right\})$

$\triangleright$  Set place to  $(f\text{adjoin } foo place)$ .

$(f\text{append } [proper-list^* foo])$

$(f\text{nconc } [non-circular-list^* foo])$

$\triangleright$  Return concatenated list or, with only one argument, foo. foo can be of any type.

$(f\text{revappend } list foo)$

$(f\text{nreconc } list foo)$

$\triangleright$  Return concatenated list after reversing order in list.

$(\begin{cases} f\text{mapcar} \\ f\text{maplist} \end{cases}) function list^+$

$\triangleright$  Return list of return values of function successively invoked with corresponding arguments, either cars or cdrs, respectively, from each list.

$(\begin{cases} f\text{mapcan} \\ f\text{mapcon} \end{cases}) function \widetilde{list^+}$

$\triangleright$  Return list of concatenated return values of function successively invoked with corresponding arguments, either cars or cdrs, respectively, from each list. function should return a list.

$(\begin{cases} f\text{mapc} \\ f\text{mapl} \end{cases}) function list^+$

$\triangleright$  Return first list after successively applying function to corresponding arguments, either cars or cdrs, respectively, from each list. function should have some side effects.

$(f\text{copy-list } list) \triangleright$  Return copy of list with shared elements.

### 4.3 Association Lists

$(f\text{pairlis } keys values [alist])$

$\triangleright$  Prepend to alist an association list made from lists keys and values.

$(f\text{acons } key value alist)$

$\triangleright$  Return alist with a  $(key . value)$  pair added.

$(\begin{cases} f\text{assoc} \\ f\text{rassoc} \end{cases}) foo alist \left\{ \begin{array}{l} \{\text{:test test}\#'\text{eq}\} \\ \{\text{:test-not test}\} \\ \{\text{:key function}\} \end{array} \right\}$

$(\begin{cases} f\text{assoc-if[-not]} \\ f\text{rassoc-if[-not]} \end{cases}) test alist [:key function])$

$\triangleright$  First cons whose car, or cdr, respectively, satisfies test.

$(f\text{copy-alist } alist) \triangleright$  Return copy of alist.

## 4.4 Trees

(**f****tree-equal** *foo bar*  $\left\{ \begin{array}{l} \text{:test } \text{test}[\#'\text{eql}] \\ \text{:test-not } \text{test} \end{array} \right\}$ )

▷ Return T if trees *foo* and *bar* have same shape and leaves satisfying *test*.

( $\left\{ \begin{array}{l} \text{fsubst new old tree} \\ \text{fnsubst new old tree} \end{array} \right\}$   $\left\{ \begin{array}{l} \text{:test function}[\#'\text{eql}] \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$ )

▷ Make copy of tree with each subtree or leaf matching *old* replaced by *new*.

( $\left\{ \begin{array}{l} \text{fsubst-if[-not] new test tree} \\ \text{fnsubst-if[-not] new test tree} \end{array} \right\}$  [**:key function**])

▷ Make copy of tree with each subtree or leaf satisfying *test* replaced by *new*.

( $\left\{ \begin{array}{l} \text{fsublis association-list tree} \\ \text{fnsublis association-list tree} \end{array} \right\}$   $\left\{ \begin{array}{l} \text{:test function}[\#'\text{eql}] \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$ )

▷ Make copy of tree with each subtree or leaf matching a key in *association-list* replaced by that key's value.

(**f****copy-tree** *tree*) ▷ Copy of tree with same shape and leaves.

## 4.5 Sets

( $\left\{ \begin{array}{l} \text{fintersection} \\ \text{fset-difference} \\ \text{funion} \\ \text{fset-exclusive-or} \\ \text{fintersection} \\ \text{fnset-difference} \\ \text{fnunion} \\ \text{fnset-exclusive-or} \end{array} \right\}$   $\left\{ \begin{array}{l} a \ b \\ \widetilde{a} \ b \\ \widetilde{a} \ \widetilde{b} \end{array} \right\}$   $\left\{ \begin{array}{l} \text{:test function}[\#'\text{eql}] \\ \text{:test-not function} \\ \text{:key function} \end{array} \right\}$ )

▷ Return  $a \cap b$ ,  $a \setminus b$ ,  $a \cup b$ , or  $a \Delta b$ , respectively, of lists *a* and *b*.

## 5 Arrays

### 5.1 Predicates

(**f****arrayp** *foo*)

(**f****vectorp** *foo*)

(**f****simple-vector-p** *foo*) ▷ T if *foo* is of indicated type.

(**f****bit-vector-p** *foo*)

(**f****simple-bit-vector-p** *foo*)

(**f****adjustable-array-p** *array*)

(**f****array-has-fill-pointer-p** *array*)

▷ T if *array* is adjustable/has a fill pointer, respectively.

(**f****array-in-bounds-p** *array [subscripts]*)

▷ Return T if *subscripts* are in *array*'s bounds.

### 5.2 Array Functions

( $\left\{ \begin{array}{l} \text{fmake-array dimension-sizes} \ [\text{:adjustable bool} \text{NIL}] \\ \text{fadjust-array } \widetilde{\text{array}} \ \text{dimension-sizes} \end{array} \right\}$ )

$\left\{ \begin{array}{l} \text{:element-type typeT} \\ \text{:fill-pointer } \{ \text{num} | \text{bool} \} \text{NIL} \\ \text{:initial-element obj} \\ \text{:initial-contents tree-or-array} \\ \text{:displaced-to array} \text{NIL} \ [\text{:displaced-index-offset i0}] \end{array} \right\}$ )

▷ Return fresh, or readjust, respectively, vector or array.

(**f****aref** *array [subscripts]*)

▷ Return array element pointed to by *subscripts*. **settable**.

(**f****row-major-aref** *array i*)

▷ Return ith element of *array* in row-major order. **settable**.

(***farray-row-major-index*** *array* [*subscripts*])  
 ▷ Index in row-major order of the element denoted by *subscripts*.

(***farray-dimensions*** *array*)  
 ▷ List containing the lengths of *array*'s dimensions.

(***farray-dimension*** *array i*)  
 ▷ Length of *i*th dimension of *array*.

(***farray-total-size*** *array*) ▷ Number of elements in *array*.

(***farray-rank*** *array*) ▷ Number of dimensions of *array*.

(***farray-displacement*** *array*) ▷ Target array and  $\frac{offset}{2}$ .

(***fbit bit-array*** [*subscripts*])  
 (***fubit simple-bit-array*** [*subscripts*])  
 ▷ Return element of *bit-array* or of *simple-bit-array*. **setfable**.

(***fbit-not*** *bit-array* [*result-bit-array<sub>NIL</sub>*])  
 ▷ Return result of bitwise negation of *bit-array*. If *result-bit-array* is T, put result in *bit-array*; if it is NIL, make a new array for result.

$\left\{ \begin{array}{l} f\text{bit-eqv} \\ f\text{bit-and} \\ f\text{bit-andc1} \\ f\text{bit-andc2} \\ f\text{bit-nand} \\ f\text{bit-ior} \\ f\text{bit-orc1} \\ f\text{bit-orc2} \\ f\text{bit-xor} \\ f\text{bit-nor} \end{array} \right\}$	<i>bit-array-a</i> <i>bit-array-b</i> [ <i>result-bit-array<sub>NIL</sub></i> ])
---	--

▷ Return result of bitwise logical operations (cf. operations of ***fboolean***, page 4) on *bit-array-a* and *bit-array-b*. If *result-bit-array* is T, put result in *bit-array-a*; if it is NIL, make a new array for result.

***carray-rank-limit*** ▷ Upper bound of array rank;  $\geq 8$ .

***carray-dimension-limit***  
 ▷ Upper bound of an array dimension;  $\geq 1024$ .

***carray-total-size-limit*** ▷ Upper bound of array size;  $\geq 1024$ .

### 5.3 Vector Functions

Vectors can as well be manipulated by sequence functions; see section 6.

(***fvector foo\****) ▷ Return fresh simple vector of foos.

(***fsvref vector i***) ▷ Element *i* of simple vector. **setfable**.

(***fvector-push foo vector***)  
 ▷ Return NIL if *vector*'s fill pointer equals size of *vector*. Otherwise replace element of *vector* pointed to by fill pointer with *foo*; then increment fill pointer.

(***fvector-push-extend foo vector [num]***)  
 ▷ Replace element of *vector* pointed to by fill pointer with *foo*, then increment fill pointer. Extend *vector*'s size by  $\geq num$  if necessary.

(***fvector-pop vector***)  
 ▷ Return element of vector its fillpointer points to after decrementation.

(***fill-pointer vector***) ▷ Fill pointer of vector. **setfable**.

## 6 Sequences

### 6.1 Sequence Predicates

( $\{f_{\text{every}}\}$   $\{f_{\text{notevery}}\}$   $\{\text{test sequence}^+\}$ )

▷ Return NIL or T, respectively, as soon as test on any set of corresponding elements of sequences returns NIL.

( $\{f_{\text{some}}\}$   $\{f_{\text{notany}}\}$   $\{\text{test sequence}^+\}$ )

▷ Return value of test or NIL, respectively, as soon as test on any set of corresponding elements of sequences returns non-NIL.

( $f_{\text{mismatch}}$   $\{\text{sequence-a sequence-b}\}$   $\left\{ \begin{array}{l} :from-end \text{ bool}_{\text{NIL}} \\ :test \text{ function}_{\#eq} \\ :test-not \text{ function} \\ :start1 \text{ start-a}_{\square} \\ :start2 \text{ start-b}_{\square} \\ :end1 \text{ end-a}_{\text{NIL}} \\ :end2 \text{ end-b}_{\text{NIL}} \\ :key \text{ function} \end{array} \right\}$ )

▷ Return position in sequence-a where sequence-a and sequence-b begin to mismatch. Return NIL if they match entirely.

### 6.2 Sequence Functions

( $f_{\text{make-sequence}}$   $\{\text{sequence-type size} [:\text{initial-element foo}]\}$ )

▷ Make sequence of sequence-type with size elements.

( $f_{\text{concatenate}}$   $\{\text{type sequence}^*\}$ )

▷ Return concatenated sequence of type.

( $f_{\text{merge}}$   $\{\text{type sequence-a sequence-b test} [:\text{key function}_{\text{NIL}}]\}$ )

▷ Return interleaved sequence of type. Merged sequence will be sorted if both sequence-a and sequence-b are sorted.

( $f_{\text{fill}}$   $\{\text{sequence foo}\}$   $\left\{ \begin{array}{l} :start \text{ start}_{\square} \\ :end \text{ end}_{\text{NIL}} \end{array} \right\}$ )

▷ Return sequence after setting elements between start and end to foo.

( $f_{\text{length}}$   $\{\text{sequence}\}$ )

▷ Return length of sequence (being value of fill pointer if applicable).

( $f_{\text{count}}$   $\{\text{foo sequence}\}$   $\left\{ \begin{array}{l} :from-end \text{ bool}_{\text{NIL}} \\ :test \text{ function}_{\#eq} \\ :test-not \text{ function} \\ :start \text{ start}_{\square} \\ :end \text{ end}_{\text{NIL}} \\ :key \text{ function} \end{array} \right\}$ )

▷ Return number of elements in sequence which match foo.

( $\{f_{\text{count-if}}\}$   $\{f_{\text{count-if-not}}\}$   $\{\text{test sequence}\}$   $\left\{ \begin{array}{l} :from-end \text{ bool}_{\text{NIL}} \\ :start \text{ start}_{\square} \\ :end \text{ end}_{\text{NIL}} \\ :key \text{ function} \end{array} \right\}$ )

▷ Return number of elements in sequence which satisfy test.

( $f_{\text{elt}}$   $\{\text{sequence index}\}$ )

▷ Return element of sequence pointed to by zero-indexed index. **setfable**.

( $f_{\text{subseq}}$   $\{\text{sequence start} [end_{\text{NIL}}]\}$ )

▷ Return subsequence of sequence between start and end. **setfable**.

( $\{f_{\text{sort}}\}$   $\{f_{\text{stable-sort}}\}$   $\{\text{sequence test} [:\text{key function}]\}$ )

▷ Return sequence sorted. Order of elements considered equal is not guaranteed/retained, respectively.

( $f_{\text{reverse}}$   $\{\text{sequence}\}$ )

( $f_{\text{nreverse}}$   $\{\text{sequence}\}$ )

▷ Return sequence in reverse order.

$\left\{ \begin{array}{l} f\text{find} \\ f\text{position} \end{array} \right\} \text{ foo sequence}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :test \text{ function } #'eq \\ :test-not \text{ test} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \end{array} \right\})$

▷ Return first element in *sequence* which matches *foo*, or its position relative to the begin of *sequence*, respectively.

$\left\{ \begin{array}{l} f\text{find-if} \\ f\text{find-if-not} \\ f\text{position-if} \\ f\text{position-if-not} \end{array} \right\} \text{ test sequence}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \end{array} \right\})$

▷ Return first element in *sequence* which satisfies *test*, or its position relative to the begin of *sequence*, respectively.

$(f\text{search} \text{ sequence-a sequence-b})$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :test \text{ function } #'eq \\ :test-not \text{ function} \\ :start1 \text{ start-a } \square \\ :start2 \text{ start-b } \square \\ :end1 \text{ end-a } \text{NIL} \\ :end2 \text{ end-b } \text{NIL} \\ :key \text{ function} \end{array} \right\})$

▷ Search *sequence-b* for a subsequence matching *sequence-a*. Return position in *sequence-b*, or NIL.

$\left\{ \begin{array}{l} f\text{remove } \text{ foo sequence} \\ f\text{delete } \text{ foo sequence} \end{array} \right\}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :test \text{ function } #'eq \\ :test-not \text{ function} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \\ :count \text{ count } \text{NIL} \end{array} \right\})$

▷ Make copy of sequence without elements matching *foo*.

$\left\{ \begin{array}{l} f\text{remove-if} \\ f\text{remove-if-not} \end{array} \right\} \text{ test sequence}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \\ :count \text{ count } \text{NIL} \end{array} \right\})$

▷ Make copy of sequence with all (or *count*) elements satisfying *test* removed.

$\left\{ \begin{array}{l} f\text{remove-duplicates } \text{ sequence} \\ f\text{delete-duplicates } \widetilde{\text{sequence}} \end{array} \right\}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :test \text{ function } #'eq \\ :test-not \text{ function} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \end{array} \right\})$

▷ Make copy of sequence without duplicates.

$\left\{ \begin{array}{l} f\text{substitute } \text{ new old sequence} \\ f\text{nsubstitute } \text{ new old sequence} \end{array} \right\}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :test \text{ function } #'eq \\ :test-not \text{ function} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \\ :count \text{ count } \text{NIL} \end{array} \right\})$

▷ Make copy of sequence with all (or *count*) *olds* replaced by *new*.

$\left\{ \begin{array}{l} f\text{substitute-if} \\ f\text{substitute-if-not} \\ f\text{nsubstitute-if} \\ f\text{nsubstitute-if-not} \end{array} \right\} \text{ new test sequence}$   $\left\{ \begin{array}{l} :from-end \text{ bool } \text{NIL} \\ :start \text{ start } \square \\ :end \text{ end } \text{NIL} \\ :key \text{ function} \\ :count \text{ count } \text{NIL} \end{array} \right\})$

▷ Make copy of sequence with all (or *count*) elements satisfying *test* replaced by *new*.

$(f\text{replace} \widetilde{\text{sequence-a}} \text{ sequence-b})$   $\left\{ \begin{array}{l} :start1 \text{ start-a } \square \\ :start2 \text{ start-b } \square \\ :end1 \text{ end-a } \text{NIL} \\ :end2 \text{ end-b } \text{NIL} \end{array} \right\})$

▷ Replace elements of *sequence-a* with elements of *sequence-b*.

(*fmap* *type function sequence*<sup>+</sup>)

▷ Apply *function* successively to corresponding elements of the *sequences*. Return values as a sequence of *type*. If *type* is **NIL**, return **NIL**.

(*fmap-into* *result-sequence function sequence*<sup>\*</sup>)

▷ Store into result-sequence successively values of *function* applied to corresponding elements of the *sequences*.

(*freduce* *function sequence* {  
| :initial-value *foo***NIL**  
| :from-end *bool***NIL**  
| :start *start***0**  
| :end *end***NIL**  
| :key *function*  
})

▷ Starting with the first two elements of *sequence*, apply *function* successively to its last return value together with the next element of *sequence*. Return last value of function.

(*fcopy-seq* *sequence*)

▷ Copy of sequence with shared elements.

## 7 Hash Tables

---

The Loop Facility provides additional hash table-related functionality; see **loop**, page 21.

Key-value storage similar to hash tables can as well be achieved using association lists and property lists; see pages 9 and 16.

(*fhash-table-p* *foo*) ▷ Return T if *foo* is of type **hash-table**.

(*fmake-hash-table* {  
| :test {*feq*|*feql*|*fequal*|*fequalp*}**#=eq#**  
| :size *int*  
| :rehash-size *num*  
| :rehash-threshold *num*  
})

▷ Make a hash table.

(*fgethash* *key hash-table [default***NIL***]*)

▷ Return object with *key* if any or default otherwise; and  $\frac{T}{2}$  if found, **NIL** otherwise. **setfable**.

(*fhash-table-count* *hash-table*)

▷ Number of entries in hash-table.

(*fremhash* *key hash-table*)

▷ Remove from *hash-table* entry with *key* and return T if it existed. Return **NIL** otherwise.

(*fclrhash* *hash-table*) ▷ Empty hash-table.

(*fmaphash* *function hash-table*)

▷ Iterate over *hash-table* calling *function* on key and value. Return **NIL**.

(*mwith-hash-table-iterator* (*foo hash-table*) (*declare* *decl*<sup>\*</sup>)<sup>\*</sup> *form*<sup>P\*</sup>)

▷ Return values of forms. In *forms*, invocations of (*foo*) return: T if an entry is returned; its key; its value.

(*fhash-table-test* *hash-table*)

▷ Test function used in hash-table.

(*fhash-table-size* *hash-table*)

(*fhash-table-rehash-size* *hash-table*)

(*fhash-table-rehash-threshold* *hash-table*)

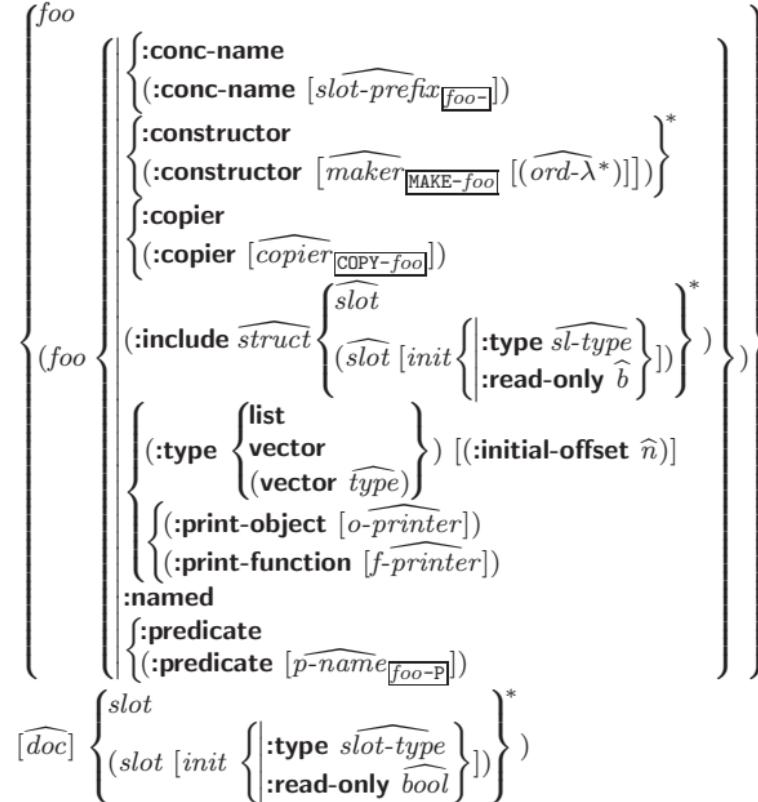

▷ Current size, rehash-size, or rehash-threshold, respectively, as used in *fmake-hash-table*.

(*fsxhash* *foo*)

▷ Hash code unique for any argument fequal foo.

## 8 Structures

(*mdefstruct*

▷ Define structure *foo* together with functions **MAKE-foo**, **COPY-foo** and *foo-P*; and **setfable** accessors *foo-slot*. Instances are of class *foo* or, if **defstruct** option **:type** is given, of the specified type. They can be created by (**MAKE-foo** *{:slot value}\*{*) or, if *ord-<math>\lambda* (see page 17) is given, by (**maker arg\*** *{:key value}\*{*). In the latter case, *args* and *:keys* correspond to the positional and keyword parameters defined in *ord-<math>\lambda* whose *vars* in turn correspond to *slots*. **:print-object**/**:print-function** generate a **gprint-object** method for an instance *bar* of *foo* calling (*o-printer bar stream*) or (*f-printer bar stream print-level*), respectively. If **:type** without **:named** is given, no *foo-P* is created.

(*fcopy-structure* *structure*)

▷ Return copy of *structure* with shared slot values.

## 9 Control Structure

### 9.1 Predicates

(*feq* *foo bar*) ▷ T if *foo* and *bar* are identical.

(*f.eql* *foo bar*)

▷ T if *foo* and *bar* are identical, or the same **character**, or **numbers** of the same type and value.

(*f.equal* *foo bar*)

▷ T if *foo* and *bar* are *f.eql*, or are equivalent **pathnames**, or are **conses** with *f(equal* cars and cdrs, or are **strings** or **bit-vectors** with *f.eql* elements below their fill pointers.

(*f.equalp* *foo bar*)

▷ T if *foo* and *bar* are identical; or are the same **character** ignoring case; or are **numbers** of the same value ignoring type; or are equivalent **pathnames**; or are **conses** or **arrays** of the same shape with *f.equalp* elements; or are structures of the same type with *f.equalp* elements; or are **hash-tables** of the same size with the same **:test** function, the same keys in terms of **:test** function, and *f.equalp* elements.

(*fnot* *foo*) ▷ T if *foo* is **NIL**; NIL otherwise.

(*fboundp* *symbol*) ▷ T if *symbol* is a special variable.

(*fconstantp* *foo [environment NIL]*)

▷ T if *foo* is a constant form.

(**ffunctionp** *foo*) ▷ T if *foo* is of type **function**.

(**fboundp**  $\left\{ \begin{array}{l} \text{foo} \\ (\text{setf } \text{foo}) \end{array} \right\}$ ) ▷ T if *foo* is a global function or macro.

---

## 9.2 Variables

( $\left\{ \begin{array}{l} \text{mdefconstant} \\ \text{mdefparameter} \end{array} \right\}$  *foo form* [*doc*])

▷ Assign value of *form* to global constant/dynamic variable *foo*.

(**mdefvar**  $\widehat{\text{foo}}$  [*form* [*doc*]])

▷ Unless bound already, assign value of *form* to dynamic variable *foo*.

( $\left\{ \begin{array}{l} \text{msetf} \\ \text{mpsetf} \end{array} \right\}$  {*place form*}\*)

▷ Set *places* to primary values of *forms*. Return values of last form/NIL; work sequentially/in parallel, respectively.

( $\left\{ \begin{array}{l} \text{ssetq} \\ \text{mpsetq} \end{array} \right\}$  {*symbol form*}\*)

▷ Set *symbols* to primary values of *forms*. Return value of last form/NIL; work sequentially/in parallel, respectively.

(**fset**  $\widetilde{\text{symbol}}$  *foo*) ▷ Set *symbol*'s value cell to *foo*. Deprecated.

(**mmultiple-value-setq** *vars form*)

▷ Set elements of *vars* to the values of *form*. Return *form*'s primary value.

(**mshiftf**  $\widetilde{\text{place}}^+ \text{ foo}$ )

▷ Store value of *foo* in rightmost *place* shifting values of *places* left, returning first place.

(**mrotatef**  $\widetilde{\text{place}}^*$ )

▷ Rotate values of *places* left, old first becoming new last *place*'s value. Return NIL.

(**fmakunbound**  $\widetilde{\text{foo}}$ ) ▷ Delete special variable *foo* if any.

(**fget** *symbol key* [defaultNIL])

(**fgetf** *place key* [defaultNIL])

▷ First entry *key* from property list stored in *symbol*/in *place*, respectively, or default if there is no *key*. **setfable**.

(**fget-properties** *property-list keys*)

▷ Return key and value of first entry from *property-list* matching a key from *keys*, and tail of *property-list* starting with that key. Return NIL, NIL, and NIL if there was no matching key in *property-list*.

(**fremprop**  $\widetilde{\text{symbol}}$  *key*)

(**mremf**  $\widetilde{\text{place}}$  *key*)

▷ Remove first entry *key* from property list stored in *symbol*/in *place*, respectively. Return T if *key* was there, or NIL otherwise.

(**sprogv** *symbols values form*\*<sup>P</sup>)

▷ Evaluate *forms* with locally established dynamic bindings of *symbols* to *values* or NIL. Return values of forms.

( $\left\{ \begin{array}{l} \text{slet} \\ \text{slet*} \end{array} \right\}$  ( $\left\{ \begin{array}{l} \text{name} \\ (\text{name } [\text{value } \underline{\text{NIL}}]) \end{array} \right\}$ \*) (**declare**  $\widehat{\text{decl}}^*$ )\* *form*\*<sup>P</sup>)

▷ Evaluate *forms* with *names* lexically bound (in parallel or sequentially, respectively) to *values*. Return values of forms.

(**mmultiple-value-bind** ( $\widehat{\text{var}}^*$ ) *values-form* (**declare**  $\widehat{\text{decl}}^*$ )\* *body-form*\*<sup>P</sup>)

▷ Evaluate *body-forms* with *vars* lexically bound to the return values of *values-form*. Return values of body-forms.

(*mdestructuring-bind* *destruct-λ bar* (**declare**  $\widehat{decl}^*$ ) $^*$  *form* $^{P*}$ )

▷ Evaluate *forms* with variables from tree *destruct-λ* bound to corresponding elements of tree *bar*, and return their values. *destruct-λ* resembles *macro-λ* (section 9.4), but without any **&environment** clause.

## 9.3 Functions

Below, ordinary lambda list (*ord-λ* $^*$ ) has the form

(*var* $^*$  [**&optional**  $\left\{ \begin{array}{l} var \\ ((var [init_{\text{NIL}} [supplied-p]])) \end{array} \right\}^* ]$  [**&rest** *var*]  
 [**&key**  $\left\{ \begin{array}{l} var \\ ((:key var)) \end{array} \right\}^* [init_{\text{NIL}} [supplied-p]] ]$  [**&allow-other-keys**]]  
 [**&aux**  $\left\{ \begin{array}{l} var \\ ((var [init_{\text{NIL}}])) \end{array} \right\}^* ]$ ).

*supplied-p* is T if there is a corresponding argument. *init* forms can refer to any *init* and *supplied-p* to their left.

( $\left\{ \begin{array}{l} m\text{defun} \left\{ \begin{array}{l} foo (ord-\lambda^*) \\ (\text{setf } foo) (new-value ord-\lambda^*) \end{array} \right\} \\ m\text{lambda} (ord-\lambda^*) \\ form^{P*} \end{array} \right\} \left| \begin{array}{l} (\text{declare } \widehat{decl}^*)^* \\ doc \end{array} \right\}$

▷ Define a function named *foo* or (**setf** *foo*), or an anonymous function, respectively, which applies *forms* to *ord-λ*s. For *mdefun*, *forms* are enclosed in an implicit **sblock** named *foo*.

( $\left\{ \begin{array}{l} s\text{flet} \\ s\text{labels} \end{array} \right\} ((\left\{ \begin{array}{l} foo (ord-\lambda^*) \\ (\text{setf } foo) (new-value ord-\lambda^*) \end{array} \right\} \left| \begin{array}{l} (\text{declare } \widehat{local-decl}^*)^* \\ doc \\ local-form^{P*})^* \end{array} \right\} (\text{declare } \widehat{decl}^*)^* \\ form^{P*}))$

▷ Evaluate *forms* with locally defined functions *foo*. Globally defined functions of the same name are shadowed. Each *foo* is also the name of an implicit **sblock** around its corresponding *local-form* $^*$ . Only for *slabels*, functions *foo* are visible inside *local-forms*. Return values of forms.

(*sfunction*  $\left\{ \begin{array}{l} foo \\ ((m\text{lambda} form^*)) \end{array} \right\} )$

▷ Return lexically innermost function named *foo* or a lexical closure of the *mlambda* expression.

(*fapply*  $\left\{ \begin{array}{l} function \\ (\text{setf } function) \end{array} \right\} arg^* args)$

▷ Values of function called with *args* and the list elements of *args*. **setfable** if *function* is one of *faref*, *fbit*, and *fsbit*.

(*ffuncall* *function* *arg* $^*$ )    ▷ Values of function called with *args*.

(*smultiple-value-call* *function* *form* $^*$ )

▷ Call *function* with all the values of each *form* as its arguments. Return values returned by function.

(*fvalues-list* *list*)    ▷ Return elements of list.

(*fvalues* *foo* $^*$ )

▷ Return as multiple values the primary values of the *foos*. **setfable**.

(*fmultiple-value-list* *form*)              ▷ List of the values of form.

(*mnth-value* *n* *form*)

▷ Zero-indexed *nth* return value of form.

(*fcomplement* *function*)

▷ Return new function with same arguments and same side effects as *function*, but with complementary truth value.

(*fconstantly* *foo*)

▷ Function of any number of arguments returning *foo*.

(*fidentity* *foo*)              ▷ Return *foo*.

(*f***unction-lambda-expression** *function*)

- ▷ If available, return lambda expression of *function*, NIL if *function* was defined in an environment without bindings, and name of *function*.

(*f***ddefinition**  $\left\{ \begin{array}{l} foo \\ (\text{setf } foo) \end{array} \right\}$ )

- ▷ Definition of global function *foo*. **setfable**.

(*f***makunbound** *foo*)

- ▷ Remove global function or macro definition *foo*.

*c***all-arguments-limit**

*c***lambda-parameters-limit**

- ▷ Upper bound of the number of function arguments or lambda list parameters, respectively;  $\geq 50$ .

*c***multiple-values-limit**

- ▷ Upper bound of the number of values a multiple value can have;  $\geq 20$ .

## 9.4 Macros

---

Below, macro lambda list (*macro-λ\**) has the form of either

([&**whole** *var*] [*E*]  $\left\{ \begin{array}{l} var \\ ((macro-λ^*)) \end{array} \right\}^* [E]$   
 [&**optional**  $\left\{ \begin{array}{l} var \\ (\{var \\ ((macro-λ^*))\}) [init_{NIL} [supplied-p]] \end{array} \right\}^* ] [E]$   
 [&**rest**  $\left\{ \begin{array}{l} rest-var \\ ((macro-λ^*)) \end{array} \right\} [E]$   
 [&**body**  $\left\{ \begin{array}{l} var \\ (\{var \\ ((macro-λ^*))\}) [init_{NIL} [supplied-p]] \end{array} \right\}^* ] [E]$   
 [&**key**  $\left\{ \begin{array}{l} var \\ (\{(:key \{var \\ ((macro-λ^*))\})\} [init_{NIL} [supplied-p]]) \end{array} \right\}^* ] [E]$   
 [&**allow-other-keys**] [&**aux**  $\left\{ \begin{array}{l} var \\ (\{var [init_{NIL}]\}) \end{array} \right\}^* ] [E])$   
 or  
 ([&**whole** *var*] [*E*]  $\left\{ \begin{array}{l} var \\ ((macro-λ^*)) \end{array} \right\}^* [E] [&**optional**  
 $\left\{ \begin{array}{l} var \\ (\{var \\ ((macro-λ^*))\}) [init_{NIL} [supplied-p]] \end{array} \right\}^* ] [E] . rest-var).$$

One toplevel [*E*] may be replaced by **&environment** *var*. *supplied-p* is T if there is a corresponding argument. *init* forms can refer to any *init* and *supplied-p* to their left.

(*m***defmacro**  $\left\{ \begin{array}{l} m\text{defmacro} \\ m\text{define-compiler-macro} \end{array} \right\} \left\{ \begin{array}{l} foo \\ ((\text{setf } foo)) \end{array} \right\} (macro-λ^*)$   
 $\left\{ \begin{array}{l} (\text{declare } \widehat{decl}^*)^* \\ doc \end{array} \right\} form^P_*$ )

- ▷ Define macro *foo* which on evaluation as (*foo tree*) applies expanded *forms* to arguments from *tree*, which corresponds to *tree-shaped macro-λs*. *forms* are enclosed in an implicit **sblock** named *foo*.

(*m***define-symbol-macro** *foo form*)

- ▷ Define symbol macro *foo* which on evaluation evaluates expanded *form*.

(*s***macrolet** ((*foo* (*macro-λ\**))  $\left\{ \begin{array}{l} (\text{declare } \widehat{local-decl}^*)^* \\ doc \end{array} \right\}$   
 $macro-form^P_*)^* ) (\text{declare } \widehat{decl}^*)^* form^P_*)$

- ▷ Evaluate forms with locally defined mutually invisible macros *foo* which are enclosed in implicit **sblocks** of the same name.

(*s***symbol-macrolet** ((*foo* *expansion-form*)\*) (**declare**  $\widehat{decl}^*)^* form^P_*)$   
 ▷ Evaluate forms with locally defined symbol macros *foo*.

(*m***defsetf**  $\widehat{function} \left\{ \begin{array}{l} \widehat{updater} [\widehat{doc}] \\ (setf-λ^*) (s-var^*) \left\{ \begin{array}{l} (\text{declare } \widehat{decl}^*)^* \\ doc \end{array} \right\} form^P_* \end{array} \right\}$ )

where defsetf lambda list (*setf-λ\**) has the form

$(var^* [&optional \{var \{(\text{var } [init}_{\text{NIL}} [supplied-p])\}\}^*] [&rest var]$   
 $[&key \{var \{\{var\} [init}_{\text{NIL}} [supplied-p]\}\}^*]$   
 $[&allow-other-keys]] [&environment var])$

▷ Specify how to **setf** a place accessed by *function*.  
**Short form:** (**setf** (*function arg\**) *value-form*) is replaced by (*update arg\** *value-form*); the latter must return *value-form*.  
**Long form:** on invocation of (**setf** (*function arg\**) *value-form*), *forms* must expand into code that sets the place accessed where *setf-λ* and *s-var\** describe the arguments of *function* and the value(s) to be stored, respectively; and that returns the value(s) of *s-var\**. *forms* are enclosed in an implicit *sblock* named *function*.

**(*mdefine-setf-expander* *function* (*macro-λ\**)  $\left\{ \begin{array}{l} (\text{declare } \widehat{\text{decl}}^*)^* \\ \widehat{\text{doc}} \end{array} \right\}$  *form<sup>P</sup>\**)**

▷ Specify how to **setf** a place accessed by *function*. On invocation of (**setf** (*function arg\**) *value-form*), *form\** must expand into code returning *arg-vars*, *args*, *newval-vars*, *set-form*, and *get-form* as described with **fget-setf-expansion** where the elements of macro lambda list *macro-λ\** are bound to corresponding *args*. *forms* are enclosed in an implicit *sblock* named *function*.

**(*fget-setf-expansion* *place* [*environment*<sub>NIL</sub>])**

▷ Return lists of temporary variables *arg-vars* and of corresponding *args* as given with *place*, list *newval-vars* with temporary variables corresponding to the new values, and *set-form* and *get-form* specifying in terms of *arg-vars* and *newval-vars* how to **setf** and how to read *place*.

**(*mdefine-modify-macro* *foo* ([&optional**

$\{var \{(\text{var } [init}_{\text{NIL}} [supplied-p])\}\}^*] [&rest var])$  *function* [*doc*])

▷ Define macro *foo* able to modify a place. On invocation of (*foo* *place arg\**), the value of *function* applied to *place* and *args* will be stored into *place* and returned.

### **clambda-list-keywords**

▷ List of macro lambda list keywords. These are at least:

**&whole** *var*

▷ Bind *var* to the entire macro call form.

**&optional** *var\**

▷ Bind *vars* to corresponding arguments if any.

**{&rest|&body}** *var*

▷ Bind *var* to a list of remaining arguments.

**&key** *var\**

▷ Bind *vars* to corresponding keyword arguments.

**&allow-other-keys**

▷ Suppress keyword argument checking. Callers can do so using :allow-other-keys T.

**&environment** *var*

▷ Bind *var* to the lexical compilation environment.

**&aux** *var\**      ▷ Bind *vars* as in *slet\**.

## 9.5 Control Flow

**(*sif* *test* *then* [*else*<sub>NIL</sub>])**

▷ Return values of *then* if *test* returns T; return values of *else* otherwise.

**(*mcond* (*test* *then*<sup>P</sup><sub>test</sub>)\*)**

▷ Return the values of the first *then\** whose *test* returns T; return *NIL* if all *tests* return *NIL*.

**( $\begin{cases} mwhen \\ munless \end{cases}$  *test* *foo*<sup>P</sup>\*)**

▷ Evaluate *foos* and return their values if *test* returns T or *NIL*, respectively. Return *NIL* otherwise.

(*mcase* *test* ( $\left\{ \begin{array}{l} (\widehat{\text{key}}^*) \\ \text{key} \end{array} \right\}$ ) *foo*<sup>P\*</sup>)<sup>\*</sup> [ $\left( \begin{array}{l} \text{otherwise} \\ \text{T} \end{array} \right)$  *bar*<sup>P\*</sup>)<sub>NIL</sub>])  
▷ Return the values of the first *foo*\* one of whose *keys* is **eql** *test*. Return values of *bars* if there is no matching *key*.

( $\left\{ \begin{array}{l} \text{mecase} \\ \text{mccase} \end{array} \right\}$  *test* ( $\left\{ \begin{array}{l} (\widehat{\text{key}}^*) \\ \text{key} \end{array} \right\}$  *foo*<sup>P\*</sup>)<sup>\*</sup>)  
▷ Return the values of the first *foo*\* one of whose *keys* is **eql** *test*. Signal non-correctable/correctable **type-error** if there is no matching *key*.

(*mand* *form*<sup>\*</sup> T)  
▷ Evaluate *forms* from left to right. Immediately return NIL if one *form*'s value is NIL. Return values of last *form* otherwise.

(*mor* *form*<sup>\*</sup> NIL)  
▷ Evaluate *forms* from left to right. Immediately return primary value of first non-NIL-evaluating form, or all values if last *form* is reached. Return NIL if no *form* returns T.

(*sprogn* *form*<sup>\*</sup> NIL)  
▷ Evaluate *forms* sequentially. Return values of last *form*.

(*smultiple-value-prog1* *form-r* *form*<sup>\*</sup>)  
(*mprog1* *form-r* *form*<sup>\*</sup>)  
(*mprog2* *form-a* *form-r* *form*<sup>\*</sup>)  
▷ Evaluate forms in order. Return values/primary value, respectively, of *form-r*.

( $\left\{ \begin{array}{l} \text{mprog} \\ \text{mprog*} \end{array} \right\}$  ( $\left\{ \begin{array}{l} \text{name} \\ (\text{name} [\text{value}_{\text{NIL}}]) \end{array} \right\}^*$ ) (**declare**  $\widehat{\text{decl}}^*$ )<sup>\*</sup>  $\left\{ \begin{array}{l} \widehat{\text{tag}} \\ \text{form} \end{array} \right\}^*$ )  
▷ Evaluate **tagbody**-like body with *names* lexically bound (in parallel or sequentially, respectively) to *values*. Return NIL or explicitly *mreturned* values. Implicitly, the whole form is a **sblock** named NIL.

(*s unwind-protect* *protected* *cleanup*<sup>\*</sup>)  
▷ Evaluate *protected* and then, no matter how control leaves *protected*, *cleanups*. Return values of *protected*.

(*s return-from* *foo* [*result*<sub>NIL</sub>])  
(*mreturn* [*result*<sub>NIL</sub>])  
▷ Have nearest enclosing **sblock** named *foo*/named NIL, respectively, return with values of *result*.

(*s tagbody* { $\widehat{\text{tag}}$ |*form*}<sup>\*</sup>)  
▷ Evaluate *forms* in a lexical environment. *tags* (symbols or integers) have lexical scope and dynamic extent, and are targets for **sgo**. Return NIL.

(*s go*  $\widehat{\text{tag}}$ )  
▷ Within the innermost possible enclosing **tagbody**, jump to a tag **f eql** *tag*.

(*s catch* *tag* *form*<sup>P\*</sup>)  
▷ Evaluate *forms* and return their values unless interrupted by **s throw**.

(*s throw* *tag* *form*)  
▷ Have the nearest dynamically enclosing **s catch** with a tag **f eq** *tag* return with the values of *form*.

(*f sleep* *n*) ▷ Wait *n* seconds; return NIL.

## 9.6 Iteration

$(\{m\text{do}\} \{m\text{do*}\} (\{var\} (\{(var [start [step]])\})^*) (stop result^P) (\text{declare } \widehat{\text{decl}}^*)^*$   
 $\{\widehat{\text{tag}}\}^* \{form\})$

▷ Evaluate **stagbody**-like body with *vars* successively bound according to the values of the corresponding *start* and *step* forms. *vars* are bound in parallel/sequentially, respectively. Stop iteration when *stop* is T. Return values of *result*\*. Implicitly, the whole form is a **sblock** named NIL.

$(m\text{dotimes} (var i [result_{\text{NIL}}]) (\text{declare } \widehat{\text{decl}}^*)^* \{\widehat{\text{tag}}|form\}^*)$

▷ Evaluate **stagbody**-like body with *var* successively bound to integers from 0 to *i* - 1. Upon evaluation of *result*, *var* is *i*. Implicitly, the whole form is a **sblock** named NIL.

$(m\text{dolist} (var list [result_{\text{NIL}}]) (\text{declare } \widehat{\text{decl}}^*)^* \{\widehat{\text{tag}}|form\}^*)$

▷ Evaluate **stagbody**-like body with *var* successively bound to the elements of *list*. Upon evaluation of *result*, *var* is NIL. Implicitly, the whole form is a **sblock** named NIL.

## 9.7 Loop Facility

$(m\text{loop} form^*)$

▷ **Simple Loop.** If *forms* do not contain any atomic Loop Facility keywords, evaluate them forever in an implicit **sblock** named NIL.

$(m\text{loop} clause^*)$

▷ **Loop Facility.** For Loop Facility keywords see below and Figure 1.

**named**  $n_{\text{NIL}}$  ▷ Give **mloop**'s implicit **sblock** a name.

**{with**  $\{var-s\}$   $\{(var-s^*)\}$  [*d-type*] [= *foo*] }+  
**{and**  $\{var-p\}$   $\{(var-p^*)\}$  [*d-type*] [= *bar*] }\*

where destructuring type specifier *d-type* has the form

$\{\text{fixnum}|\text{float}|T|\text{NIL}|\{\text{of-type }\{type\} \{(type^*)\}\}\}$

▷ Initialize (possibly trees of) local variables *var-s* sequentially and *var-p* in parallel.

**{for|as}**  $\{var-s\}$   $\{(var-s^*)\}$  [*d-type*] }+ **{and**  $\{var-p\}$   $\{(var-p^*)\}$  [*d-type*] }\*

▷ Begin of iteration control clauses. Initialize and step (possibly trees of) local variables *var-s* sequentially and *var-p* in parallel. Destructuring type specifier *d-type* as with **with**.

**{upfrom|from|downfrom}** *start*

▷ Start stepping with *start*

**{upto|downto|to|below|above}** *form*

▷ Specify *form* as the end value for stepping.

**{in|on}** *list*

▷ Bind *var* to successive elements/tails, respectively, of *list*.

**by** {*step*<sub>①</sub>|*function*<sub>#'cdr</sub>}

▷ Specify the (positive) decrement or increment or the *function* of one argument returning the next part of the list.

= *foo* [**then** *bar*<sub>#'*foo*</sub>]

▷ Bind *var* initially to *foo* and later to *bar*.

**across** *vector*

▷ Bind *var* to successive elements of *vector*.

**being** {**the|each**}

▷ Iterate over a hash table or a package.

**{hash-key|hash-keys}** {**of|in**} *hash-table* [**using**  
**(hash-value** *value*)]

▷ Bind *var* successively to the keys of *hash-table*; bind *value* to corresponding values.

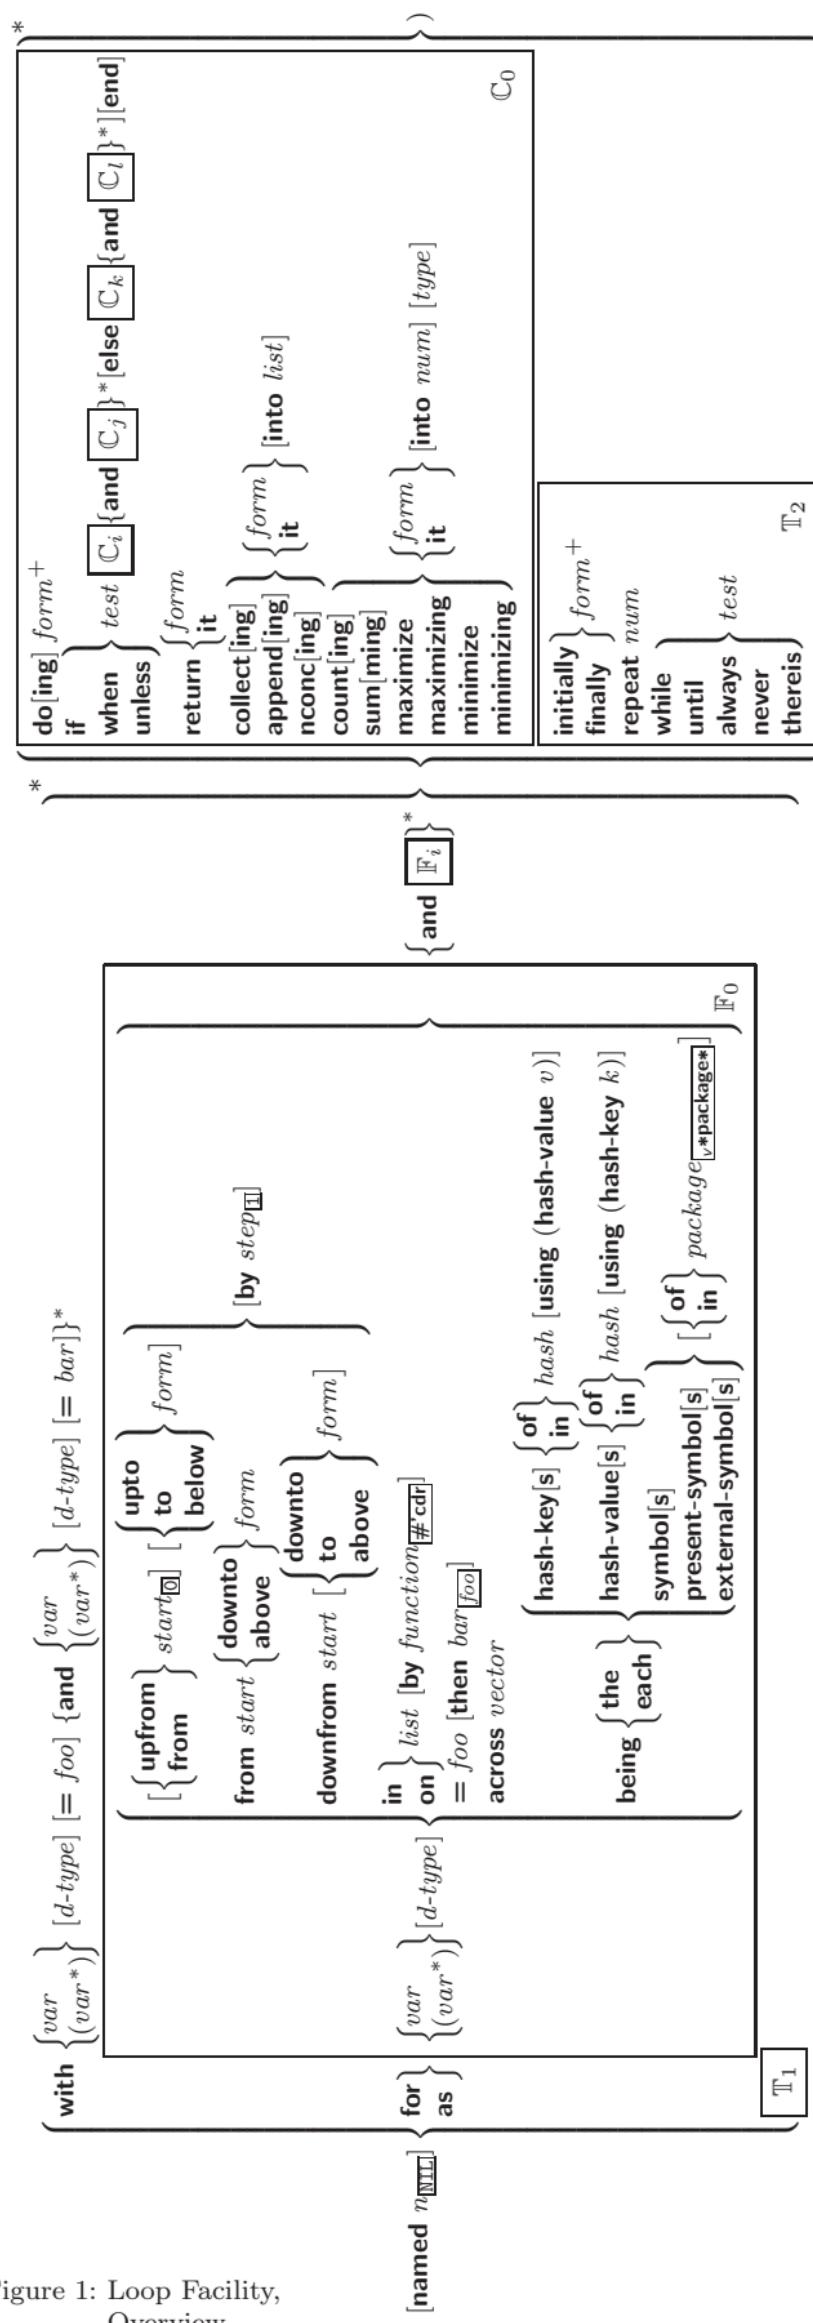

Figure 1. Loop Facility Overview.

**{hash-value|hash-values} {of|in} hash-table [using  
(hash-key key)]**

- ▷ Bind *var* successively to the values of *hash-table*; bind *key* to corresponding keys.

**{symbol|symbols|present-symbol|present-symbols|  
external-symbol|external-symbols} [{of|in}  
package|~~\*package\*~~]**

- ▷ Bind *var* successively to the accessible symbols, or the present symbols, or the external symbols respectively, of *package*.

**{do|doing} form<sup>+</sup>**

- ▷ Evaluate *forms* in every iteration.

**{if|when|unless} test i-clause {and j-clause}\* [else k-clause  
{and l-clause}\*] [end]**

- ▷ If *test* returns T, T, or NIL, respectively, evaluate *i-clause* and *j-clauses*; otherwise, evaluate *k-clause* and *l-clauses*.
- it** ▷ Inside *i-clause* or *k-clause*: value of test.

**return {form|it}**

- ▷ Return immediately, skipping any **finally** parts, with values of *form* or **it**.

**{collect|collecting} {form|it} [into list]**

- ▷ Collect values of *form* or **it** into *list*. If no *list* is given, collect into an anonymous list which is returned after termination.

**{append|appending|nconc|nconcing} {form|it} [into list]**

- ▷ Concatenate values of *form* or **it**, which should be lists, into *list* by the means of **fappend** or **fncconc**, respectively. If no *list* is given, collect into an anonymous list which is returned after termination.

**{count|counting} {form|it} [into n] [type]**

- ▷ Count the number of times the value of *form* or of **it** is T. If no *n* is given, count into an anonymous variable which is returned after termination.

**{sum|summing} {form|it} [into sum] [type]**

- ▷ Calculate the sum of the primary values of *form* or of **it**. If no *sum* is given, sum into an anonymous variable which is returned after termination.

**{maximize|maximizing|minimize|minimizing} {form|it} [into  
max-min] [type]**

- ▷ Determine the maximum or minimum, respectively, of the primary values of *form* or of **it**. If no *max-min* is given, use an anonymous variable which is returned after termination.

**{initially|finally} form<sup>+</sup>**

- ▷ Evaluate *forms* before begin, or after end, respectively, of iterations.

**repeat num**

- ▷ Terminate **mloop** after *num* iterations; *num* is evaluated once.

**{while|until} test**

- ▷ Continue iteration until *test* returns NIL or T, respectively.

**{always|never} test**

- ▷ Terminate **mloop** returning NIL and skipping any **finally** parts as soon as *test* is NIL or T, respectively. Otherwise continue **mloop** with its default return value set to T.

**thereis test**

- ▷ Terminate **mloop** when *test* is T and return value of *test*, skipping any **finally** parts. Otherwise continue **mloop** with its default return value set to NIL.

**(mloop-finish)**

- ▷ Terminate **mloop** immediately executing any **finally** clauses and returning any accumulated results.

## 10 CLOS

### 10.1 Classes

(**fslot-exists-p** *foo bar*)

▷ T if *foo* has a slot *bar*.

(**fslot-boundp** *instance slot*) ▷ T if *slot* in *instance* is bound.

(**mdefclass** *foo* (*superclass\** standard-object))

(slot { (:reader reader)\*  
(:writer {writer  
(**setf** writer)})}\*  
(:accessor accessor)\*  
:allocation {(:instance)  
(:class :instance)} ) } )  
{ (:default-initargs {name value}\* )  
(:documentation class-doc)  
(:metaclass name standard-class) } )

▷ Define or modify class *foo* as a subclass of *superclasses*. Transform existing instances, if any, by **gmake-instances-obsolete**.

In a new instance *i* of *foo*, a *slot*'s value defaults to *form* unless set via *[:]initarg-name*; it is readable via (*reader i*) or (*accessor i*), and writable via (*writer value i*) or (**setf** (*accessor i*) *value*). *slots* with **:allocation :class** are shared by all instances of class *foo*.

(**ffind-class** *symbol* [*errorp* [ *environment*]])

▷ Return class named *symbol*. **setfable**.

(**gmake-instance** *class* {[*]initarg value*\* *other-keyarg\**})

▷ Make new instance of *class*.

(**greinitialize-instance** *instance* {[*]initarg value*\* *other-keyarg\**})

▷ Change local slots of instance according to *initargs* by means of **gshared-initialize**.

(**fslot-value** *foo slot*) ▷ Return value of *slot* in *foo*. **setfable**.

(**fslot-makunbound** *instance slot*)

▷ Make *slot* in instance unbound.

({*mwith-slots* ((slot | (var slot))\*)  
*mwith-accessors* ((var *accessor*)\*)} *instance* (**declare** decl)\*  
*form*<sup>P\*</sup>)

▷ Return values of *forms* after evaluating them in a lexical environment with slots of *instance* visible as **setfable slots** or *vars*/with *accessors* of *instance* visible as **setfable vars**.

(**gclass-name** *class*)

((**setf** **gclass-name**) *new-name class*)

▷ Get/set name of *class*.

(**fclass-of** *foo*) ▷ Class *foo* is a direct instance of.

(**gchange-class** instance *new-class* {[*]initarg value*\* *other-keyarg\**})

▷ Change class of instance to *new-class*. Retain the status of any slots that are common between *instance*'s original class and *new-class*. Initialize any newly added slots with the *values* of the corresponding *initargs* if any, or with the values of their **:initform** forms if not.

(**gmake-instances-obsolete** *class*)

▷ Update all existing instances of *class* using **gupdate-instance-for-redefined-class**.

({*ginitialize-instance* *instance*  
*gupdate-instance-for-different-class* *previous current*} )

{[*]initarg value*\* *other-keyarg\**)

▷ Set slots on behalf of **gmake-instance**/of **gchange-class** by means of **gshared-initialize**.

(**gupdate-instance-for-redefined-class** *new-instance added-slots*

*discarded-slots discarded-slots-property-list*

{[*]initarg value*\* *other-keyarg\**)

▷ On behalf of **gmake-instances-obsolete** and by means of **gshared-initialize**, set any *initarg* slots to their corresponding *values*; set any remaining *added-slots* to the *values* of their **:initform** forms. Not to be called by user.

(***gallocate-instance*** *class* {[*:initarg* *value*]}\* *other-keyarg*\*)  
 ▷ Return uninitialized instance of *class*. Called by ***gmake-instance***.

(***gshared-initialize*** *instance* {*initform-slots*}  
 ▷ Fill the *initarg-slots* of *instance* with the corresponding *values*, and fill those *initform-slots* that are not *initarg-slots* with the values of their **:initform** forms.

(***gslot-missing*** *class* *instance* *slot* {*setf*  
***slot-boundp***  
***slot-makunbound***  
***slot-value***} [*value*])

(***gslot-unbound*** *class* *instance* *slot*)  
 ▷ Called on attempted access to non-existing or unbound *slot*. Default methods signal **error/unbound-slot**, respectively. Not to be called by user.

## 10.2 Generic Functions

(***fnext-method-p***) ▷ T if enclosing method has a next method.

(***mdefgeneric*** {*foo*  
 {*(setf foo)*} } (*required-var*\* [&**optional** {*var*}\*]  
 [&**rest** *var*] [&**key** {*var*}\*] [&**allow-other-keys**])  
 {*(:argument-precedence-order required-var+)*  
*(declare (optimize method-selection-optimization)+)*  
*(:documentation string)*  
*(:generic-function-class gf-class standard-generic-function)*  
*(:method-class method-class standard-method)*  
*(:method-combination c-type standard c-arg\*)*  
*(:method defmethod-args)\**})

▷ Define or modify generic function *foo*. Remove any methods previously defined by **defgeneric**. *gf-class* and the lambda parameters *required-var\** and *var\** must be compatible with existing methods. *defmethod-args* resemble those of ***mdefmethod***. For *c-type* see section 10.3.

(***fensure-generic-function*** {*foo*  
 {*(setf foo)*} } {*:argument-precedence-order required-var+*  
*:declare (optimize method-selection-optimization)*  
*:documentation string*  
*:generic-function-class gf-class*  
*:method-class method-class*  
*:method-combination c-type c-arg\**  
*:lambda-list lambda-list*  
*:environment environment*})

▷ Define or modify generic function *foo*. *gf-class* and *lambda-list* must be compatible with a pre-existing generic function or with existing methods, respectively. Changes to *method-class* do not propagate to existing methods. For *c-type* see section 10.3.

(***mdefmethod*** {*foo*  
 {*(setf foo)*} } [{*:before*  
*:after*  
*:around*  
*qualifier\**}][*primary method*]  
 {*var*  
 {*(spec-var class (eql bar))*}\*} [&**optional**  
 {*var*  
 {*(var [init supplied-p])*}\*}] [&**rest** *var*] [&**key**  
 {*var*  
 {*(var (key var))*} [*init supplied-p*]}]\* [&**allow-other-keys**]  
 [&**aux** {*var*  
 {*(var [init])*}\*}] ) {*(declare doc\*)\**} *form*\*)

▷ Define new method for generic function *foo*. *spec-vars* specialize to either being of *class* or being **eql** *bar*, respectively. On invocation, *vars* and *spec-vars* of the new method act like parameters of a function with body *form\**. *forms* are enclosed in an implicit **sblock** *foo*. Applicable *qualifiers* depend on the **method-combination** type; see section 10.3.

( $\begin{cases} g\text{add-method} \\ g\text{remove-method} \end{cases}$ ) *generic-function method*)

▷ Add (if necessary) or remove (if any) *method* to/from *generic-function*.

(*gfind-method* *generic-function qualifiers specializers [error]*)

▷ Return suitable method, or signal **error**.

(*gcompute-applicable-methods* *generic-function args*)

▷ List of methods suitable for *args*, most specific first.

(*fcall-next-method* *arg\* [current args]*)

▷ From within a method, call next method with *args*; return its values.

(*gno-applicable-method* *generic-function arg\**)

▷ Called on invocation of *generic-function* on *args* if there is no applicable method. Default method signals **error**. Not to be called by user.

( $\begin{cases} f\text{invalid-method-error } method \\ f\text{method-combination-error} \end{cases}$ ) *control arg\**)

▷ Signal **error** on applicable method with invalid qualifiers, or on method combination. For *control* and *args* see **format**, page 36.

(*gno-next-method* *generic-function method arg\**)

▷ Called on invocation of **call-next-method** when there is no next method. Default method signals **error**. Not to be called by user.

(*gfunction-keywords* *method*)

▷ Return list of keyword parameters of *method* and  $\frac{T}{Z}$  if other keys are allowed.

(*gmethod-qualifiers* *method*)      ▷ List of qualifiers of *method*.

---

## 10.3 Method Combination Types

---

### standard

▷ Evaluate most specific **:around** method supplying the values of the generic function. From within this method, **fcall-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, call all **:before** methods, most specific first, and the most specific primary method which supplies the values of the calling **fcall-next-method** if any, or of the generic function; and which can call less specific primary methods via **fcall-next-method**. After its return, call all **:after** methods, least specific first.

**and|or|append|list|nconc|progn|max|min|+**

▷ Simple built-in **method-combination** types; have the same usage as the *c-types* defined by the short form of **mdefine-method-combination**.

(*mdefine-method-combination* *c-type*

$\left\{ \begin{array}{l} \text{:documentation } \widehat{\text{string}} \\ \text{:identity-with-one-argument } \text{bool}_{\text{NIL}} \\ \text{:operator } \text{operator}_{\text{[c-type]}} \end{array} \right\}$ )

▷ **Short Form.** Define new **method-combination** *c-type*. In a generic function using *c-type*, evaluate most specific **:around** method supplying the values of the generic function. From within this method, **fcall-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, return from the calling **call-next-method** or from the generic function, respectively, the values of *(operator (primary-method gen-arg\*)\*)*, *gen-arg\** being the arguments of the generic function. The *primary-methods* are ordered  $\left\{ \begin{array}{l} \text{:most-specific-first} \\ \text{:most-specific-last} \end{array} \right\} \boxed{\text{:most-specific-first}}$  (specified as *c-arg* in *mdefgeneric*). Using *c-type* as the *qualifier* in *mdefmethod* makes the method primary.

*(mdefine-method-combination c-type (ord-λ\*)) ((group*

$$\left\{ \begin{array}{l} * \\ (\text{qualifier}^* [*]) \\ \text{predicate} \end{array} \right\}$$

$$\left\{ \begin{array}{l} \text{:description control} \\ \text{:order } \left\{ \begin{array}{l} \text{:most-specific-first} \\ \text{:most-specific-last} \end{array} \right\} \boxed{\text{:most-specific-first}} \\ \text{:required bool} \end{array} \right\} )^*$$

$$\left\{ \begin{array}{l} (\text{:arguments method-combination-λ*}) \\ (\text{:generic-function symbol}) \\ \left\{ \begin{array}{l} (\text{declare decl}^*)^* \\ \widehat{\text{doc}} \end{array} \right\} \end{array} \right\} \text{body}^{P*}$$

▷ **Long Form.** Define new **method-combination** *c-type*. A call to a generic function using *c-type* will be equivalent to a call to the forms returned by *body\** with *ord-λ\** bound to *c-arg\** (cf. *mdefgeneric*), with *symbol* bound to the generic function, with *method-combination-λ\** bound to the arguments of the generic function, and with *groups* bound to lists of methods. An applicable method becomes a member of the left-most *group* whose *predicate* or *qualifiers* match. Methods can be called via *mcall-method*. Lambda lists (*ord-λ\**) and (*method-combination-λ\**) according to *ord-λ* on page 17, the latter enhanced by an optional **&whole** argument.

*(mcall-method*

$$\left\{ \begin{array}{l} \widehat{\text{method}} \\ (\text{mmake-method form}) \end{array} \right\} [(\left\{ \begin{array}{l} \widehat{\text{next-method}} \\ (\text{mmake-method form}) \end{array} \right\} )^*]$$

▷ From within an effective method form, call *method* with the arguments of the generic function and with information about its *next-methods*; return its values.

## 11 Conditions and Errors

For standardized condition types cf. Figure 2 on page 31.

*(mdefine-condition foo (parent-type\* **condition**)*

$$\left( \begin{array}{l} \text{slot} \\ (\text{slot} \left\{ \begin{array}{l} \{ \text{:reader reader} \}^* \\ \{ \text{:writer writer} \\ (\text{setf writer}) \}^* \\ \{ \text{:accessor accessor} \}^* \\ \text{:allocation } \left\{ \begin{array}{l} \text{:instance} \\ \{ \text{:class class} \\ \text{:instance} \} \end{array} \right\} \\ \{ \text{:initarg [:initarg-name}^* \\ \text{:initform form} \\ \text{:type type} \\ \text{:documentation slot-doc} \end{array} \right\}^* \end{array} \right) \\ \left( \begin{array}{l} \{ \text{:default-initargs } \{ \text{name value} \}^* \} \\ \{ \text{:documentation condition-doc} \} \\ \{ \text{:report } \left\{ \begin{array}{l} \text{string} \\ \text{report-function} \end{array} \right\} \} \end{array} \right) \end{array} \right)$$

▷ Define, as a subtype of *parent-types*, condition type *foo*. In a new condition, a *slot*'s value defaults to *form* unless set via *[:initarg-name]*; it is readable via *(reader i)* or *(accessor i)*, and writable via *(writer value i)* or *(setf (accessor i) value)*. With **:allocation :class**, *slot* is shared by all conditions of type *foo*. A condition is reported by *string* or by *report-function* of arguments condition and stream.

(*fmake-condition* *condition-type* {[*:initarg-name* *value*}\*)

▷ Return new instance of *condition-type*.

( $\left\{ \begin{array}{l} f\text{signal} \\ f\text{warn} \\ f\text{error} \end{array} \right\} \left\{ \begin{array}{l} \text{condition} \\ \text{condition-type } \{[:\text{initarg-name } \text{value}\}^* \\ \text{control arg}^* \end{array} \right\} )$ )

▷ Unless handled, signal as **condition**, **warning** or **error**, respectively, *condition* or a new instance of *condition-type* or, with *fformat* *control* and *args* (see page 36), **simple-condition**, **simple-warning**, or **simple-error**, respectively. From *fsignal* and *fwarn*, return NIL.

(*ferror* *continue-control*

$\left\{ \begin{array}{l} \text{condition continue-arg}^* \\ \text{condition-type } \{[:\text{initarg-name } \text{value}\}^* \\ \text{control arg}^* \end{array} \right\} )$

▷ Unless handled, signal as correctable **error condition** or a new instance of *condition-type* or, with *fformat* *control* and *args* (see page 36), **simple-error**. In the debugger, use *fformat* arguments *continue-control* and *continue-args* to tag the continue option. Return NIL.

(*mignore-errors* *form*<sup>P\*</sup>)

▷ Return values of *forms* or, in case of **errors**, NIL and the condition.

(*finvoke-debugger* *condition*)

▷ Invoke debugger with *condition*.

(*massert* *test* [(*place*\*))

$\left[ \begin{array}{l} \text{condition continue-arg}^* \\ \text{condition-type } \{[:\text{initarg-name } \text{value}\}^* \\ \text{control arg}^* \end{array} \right] ] )$

▷ If *test*, which may depend on *places*, returns NIL, signal as correctable **error condition** or a new instance of *condition-type* or, with *fformat* *control* and *args* (see page 36), **error**. When using the debugger's continue option, *places* can be altered before re-evaluation of *test*. Return NIL.

(*mhandler-case* *foo* (*type* ([*var*]) (*declare* *decl*<sup>\*</sup>)<sup>\*</sup> *condition-form*<sup>P\*</sup>)<sup>\*</sup> [(:**no-error** (*ord-λ*<sup>\*</sup>) (*declare* *decl*<sup>\*</sup>)<sup>\*</sup> *form*<sup>P\*</sup>)])

▷ If, on evaluation of *foo*, a condition of *type* is signalled, evaluate matching *condition-forms* with *var* bound to the condition, and return their values. Without a condition, bind *ord-λs* to values of *foo* and return values of *forms* or, without a **:no-error** clause, return values of *foo*. See page 17 for (*ord-λ*<sup>\*</sup>).

(*mhandler-bind* ((*condition-type* *handler-function*)\*) *form*<sup>P\*</sup>)

▷ Return values of *forms* after evaluating them with *condition-types* dynamically bound to their respective *handler-functions* of argument condition.

(*mwith-simple-restart* ( $\left\{ \begin{array}{l} \text{restart} \\ \text{NIL} \end{array} \right\} \text{control arg}^* ) \text{form}$ <sup>P\*</sup>)

▷ Return values of *forms* unless *restart* is called during their evaluation. In this case, describe *restart* using *fformat* *control* and *args* (see page 36) and return NIL and T.

(*mrestart-case* *form* (*restart* (*ord-λ*<sup>\*</sup>)) { $\left\{ \begin{array}{l} :\text{interactive } \text{arg-function} \\ :\text{report } \left\{ \text{report-function} \\ \text{string}["\text{restart"}] \end{array} \right\} \\ :\text{test } \text{test-function} \end{array} \right\}$ )

*(declare* *decl*<sup>\*</sup>)<sup>\*</sup> *restart-form*<sup>P\*</sup>)<sup>\*</sup>)

▷ Return values of *form* or, if during evaluation of *form* one of the dynamically established *restarts* is called, the values of its *restart-forms*. A *restart* is visible under *condition* if (*funcall* #'*test-function* *condition*) returns T. If presented in the debugger, *restarts* are described by *string* or by #'*report-function* (of a stream). A *restart* can be called by (*invoke-restart* *restart arg*<sup>\*</sup>), where *args* match *ord-λ*<sup>\*</sup>, or by (*invoke-restart-interactively* *restart*) where a list of the respective *args* is supplied by #'*arg-function*. See page 17 for *ord-λ*<sup>\*</sup>.

(*mrestart-bind* (( $\overbrace{\text{NIL}}^{\text{restart}}$ ) *restart-function*  
   {  
     | :**interactive-function** *arg-function*  
     | :**report-function** *report-function*  
     | :**test-function** *test-function*  
   })\*) *form*<sup>P\*</sup>)

▷ Return values of forms evaluated with dynamically established *restarts* whose *restart-functions* should perform a non-local transfer of control. A restart is visible under *condition* if (*test-function condition*) returns T. If presented in the debugger, *restarts* are described by *restart-function* (of a stream). A *restart* can be called by (**invoke-restart** *restart arg\**), where *args* must be suitable for the corresponding *restart-function*, or by (**invoke-restart-interactively** *restart*) where a list of the respective *args* is supplied by *arg-function*.

(*finvoke-restart* *restart arg\**)

(*finvoke-restart-interactively* *restart*)

▷ Call function associated with *restart* with arguments given or prompted for, respectively. If *restart* function returns, return its values.

( $\begin{cases} f\text{find-restart} \\ f\text{compute-restarts } name \end{cases}$ ) [*condition*])

▷ Return innermost *restart name*, or a list of all restarts, respectively, out of those either associated with *condition* or un-associated at all; or, without *condition*, out of all restarts. Return NIL if search is unsuccessful.

(*frestart-name* *restart*)     ▷ Name of restart.

( $\begin{cases} f\text{abort} \\ f\text{muffle-warning} \\ f\text{continue} \\ f\text{store-value } value \\ f\text{use-value } value \end{cases}$ ) [*condition*<sub>NIL</sub>])

▷ Transfer control to innermost applicable restart with same name (i.e. **abort**, ..., **continue** ...) out of those either associated with *condition* or un-associated at all; or, without *condition*, out of all restarts. If no restart is found, signal **control-error** for *fabort* and *fmuffle-warning*, or return NIL for the rest.

(*mwith-condition-restarts* *condition restarts form*<sup>P\*</sup>)

▷ Evaluate *forms* with *restarts* dynamically associated with *condition*. Return values of forms.

(*farithmetic-error-operation* *condition*)

(*farithmetic-error-operands* *condition*)

▷ List of function or of its operands respectively, used in the operation which caused *condition*.

(*fcell-error-name* *condition*)

▷ Name of cell which caused *condition*.

(*funbound-slot-instance* *condition*)

▷ Instance with unbound slot which caused *condition*.

(*fprint-not-readable-object* *condition*)

▷ The object not readably printable under *condition*.

(*fpackage-error-package* *condition*)

(*ffile-error-pathname* *condition*)

(*fstream-error-stream* *condition*)

▷ Package, path, or stream, respectively, which caused the *condition* of indicated type.

(*ftype-error-datum* *condition*)

(*ftype-error-expected-type* *condition*)

▷ Object which caused *condition* of type **type-error**, or its expected type, respectively.

(*fsimple-condition-format-control* *condition*)

(*fsimple-condition-format-arguments* *condition*)

▷ Return *fformat* control or list of *fformat* arguments, respectively, of *condition*.

*v\*break-on-signals\**<sub>NIL</sub>

▷ Condition type debugger is to be invoked on.

**\*debugger-hook\***<sub>NIL</sub>

▷ Function of condition and function itself. Called before debugger.

## 12 Types and Classes

---

For any class, there is always a corresponding type of the same name.

(**ftypep** *foo type [environment]*)      ▷ T if *foo* is of *type*.

(**fsubtypep** *type-a type-b [environment]*)

▷ Return T if *type-a* is a recognizable subtype of *type-b*, and NIL if the relationship could not be determined.

(**sthe**  $\widehat{\text{type}}$  *form*)      ▷ Declare values of form to be of *type*.

(**fcoerce** *object type*)      ▷ Coerce object into *type*.

( $\begin{cases} m\text{etypecase} \\ m\text{ctypecase} \end{cases}$  *foo (type a-form\*)\* [(otherwise T b-form)]*)

▷ Return values of the first a-form\* whose *type* is *foo* of. Return values of b-forms if no *type* matches.

( $\begin{cases} m\text{etypecase} \\ m\text{ctypecase} \end{cases}$  *foo (type form\*)\**)

▷ Return values of the first form\* whose *type* is *foo* of. Signal non-correctable/correctable **type-error** if no *type* matches.

(**ftype-of** *foo*)      ▷ Type of foo.

(**mcheck-type** *place type [string]*)

▷ Signal correctable **type-error** if *place* is not of *type*. Return NIL.

(**fstream-element-type** *stream*)      ▷ Type of stream objects.

(**farray-element-type** *array*)      ▷ Element type *array* can hold.

(**fupgraded-array-element-type** *type [environment]*)

▷ Element type of most specialized array capable of holding elements of *type*.

(**mdeftype** *foo (macro-λ\*) {declare doc} form\**)

▷ Define type *foo* which when referenced as (*foo arg\**) (or as *foo* if *macro-λ* doesn't contain any required parameters) applies expanded *forms* to *args* returning the new type. For (*macro-λ\**) see page 18 but with default value of \* instead of NIL. *forms* are enclosed in an implicit **sblock** named *foo*.

(**eql** *foo*)  
(**member** *foo\**)      ▷ Specifier for a type comprising *foo* or *foos*.

(**satisfies** *predicate*)

▷ Type specifier for all objects satisfying *predicate*.

(**mod** *n*)      ▷ Type specifier for all non-negative integers < *n*.

(**not** *type*)      ▷ Complement of type.

(**and** *type\**)      ▷ Type specifier for intersection of *types*.

(**or** *type\**)      ▷ Type specifier for union of *types*.

(**values** *type\* [&optional type\* [&rest other-args]]*)

▷ Type specifier for multiple values.

\*      ▷ As a type argument (cf. Figure 2): no restriction.

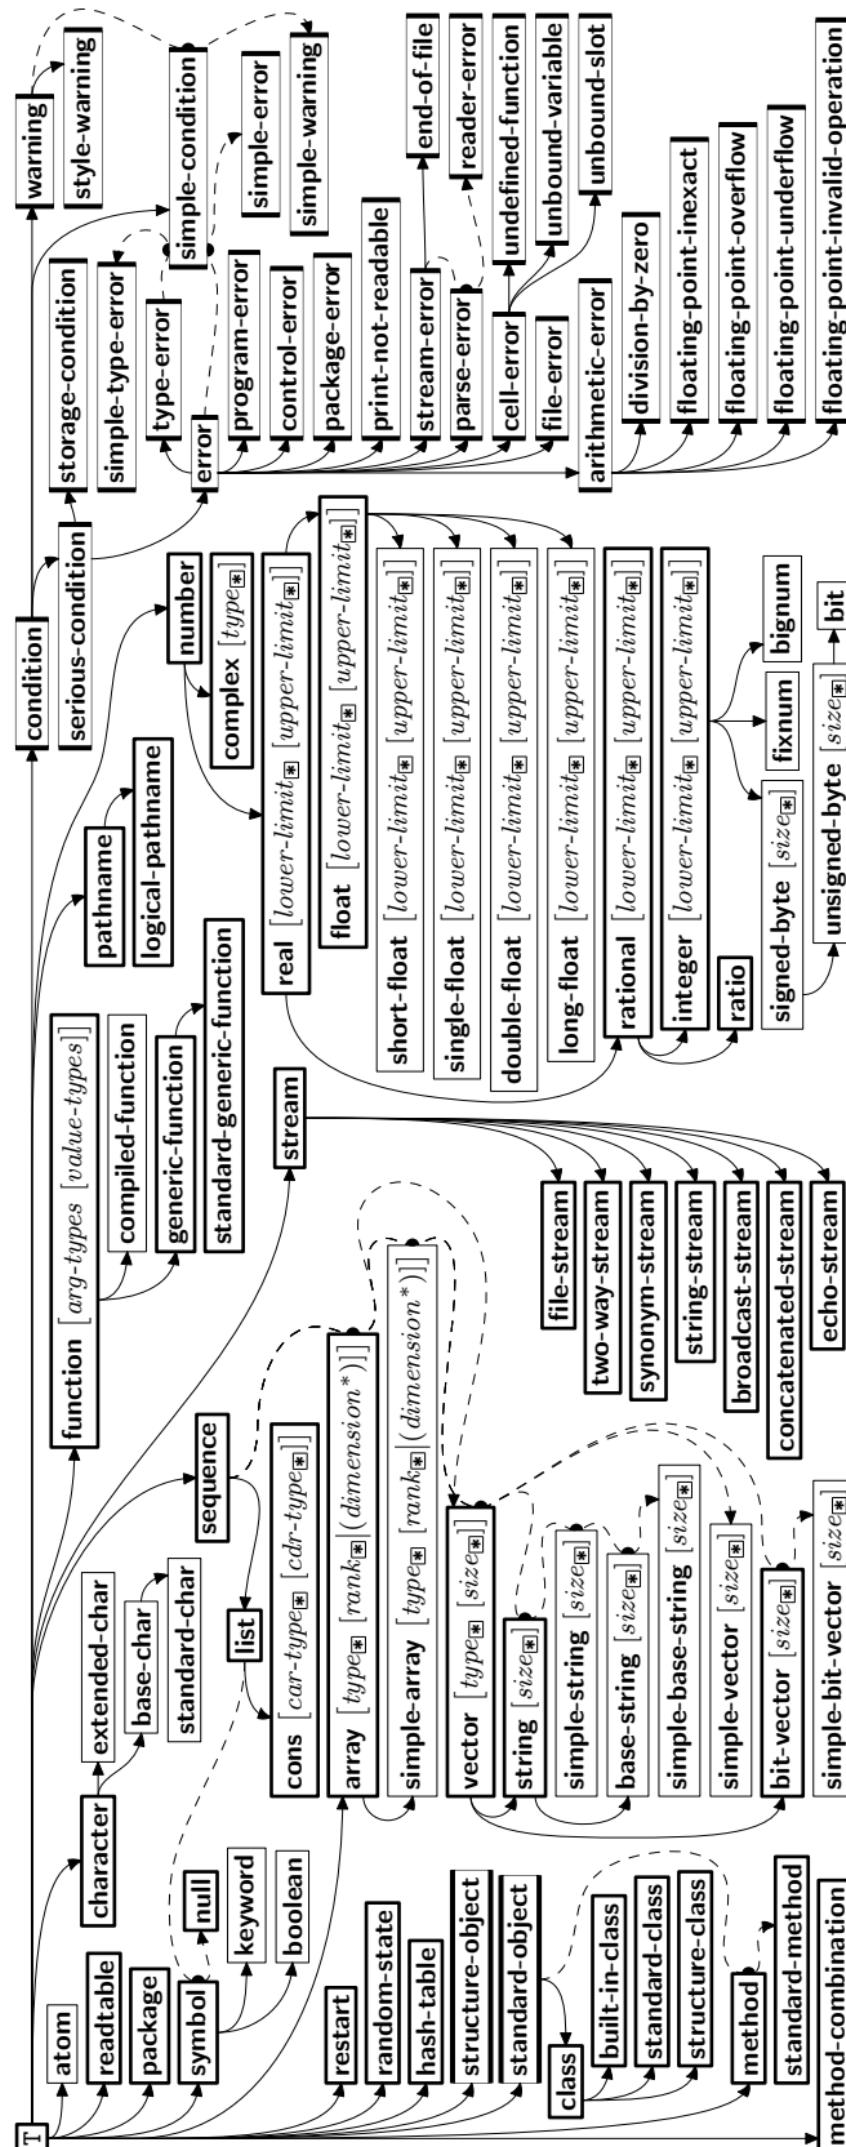

Figure 2: Precedence Order of System Classes (□), Classes (■), Types (□), and Condition Types (□). Every type is also a supertype of NIL, the empty type.

# 13 Input/Output

## 13.1 Predicates

(*fstreamp* *foo*)  
 (*fpathnamep* *foo*) ▷ T if *foo* is of indicated type.  
 (*freadtablep* *foo*)

(*finput-stream-p* *stream*)  
 (*foutput-stream-p* *stream*)  
 (*finteractive-stream-p* *stream*)  
 (*fopen-stream-p* *stream*)  
 ▷ Return T if *stream* is for input, for output, interactive, or open, respectively.

(*f pathname-match-p* *path wildcard*)  
 ▷ T if *path* matches *wildcard*.

(*f wild-pathname-p* *path* [*{:host|:device|:directory|:name|:type|:version|NIL}*])  
 ▷ Return T if indicated component in *path* is wildcard. (NIL indicates any component.)

## 13.2 Reader

(*{fy-or-n-p|yes-or-no-p}* [*control arg\**])  
 ▷ Ask user a question and return T or NIL depending on their answer. See page 36, *fformat*, for *control* and *args*.

(*mwith-standard-io-syntax* *form<sup>P\*</sup>*)  
 ▷ Evaluate *forms* with standard behaviour of reader and printer. Return values of *forms*.

(*{fread|fread-preserving-whitespace}* [*stream<sub>v\*standard-input\*</sub> eof-err<sub>T</sub>*  
 [*eof-val<sub>NIL</sub> [recursive<sub>NIL</sub>]*]])  
 ▷ Read printed representation of object.

(*fread-from-string* *string* [*eof-error<sub>T</sub> eof-val<sub>NIL</sub>*  
 [*{:start start<sub>0</sub>|:end end<sub>NIL</sub>|:preserve-whitespace bool<sub>NIL</sub>*]]])  
 ▷ Return object read from *string* and zero-indexed position of next character.

(*fread-delimited-list* *char* [*stream<sub>v\*standard-input\*</sub> [recursive<sub>NIL</sub>]*])  
 ▷ Continue reading until encountering *char*. Return list of objects read. Signal error if no *char* is found in stream.

(*fread-char* [*stream<sub>v\*standard-input\*</sub> [eof-err<sub>T</sub> eof-val<sub>NIL</sub> [recursive<sub>NIL</sub>]]]*])  
 ▷ Return next character from *stream*.

(*fread-char-no-hang* [*stream<sub>v\*standard-input\*</sub> [eof-error<sub>T</sub> [eof-val<sub>NIL</sub> [recursive<sub>NIL</sub>]]]*])  
 ▷ Next character from *stream* or NIL if none is available.

(*fpeek-char* [*mode<sub>NIL</sub> [stream<sub>v\*standard-input\*</sub> [eof-error<sub>T</sub> [eof-val<sub>NIL</sub> [recursive<sub>NIL</sub>]]]]*])  
 ▷ Next, or if *mode* is T, next non-whitespace character, or if *mode* is a character, next instance of it, from *stream* without removing it there.

(*funread-char* *character* [*stream<sub>v\*standard-input\*</sub>*])  
 ▷ Put last *fread-chared* *character* back into *stream*; return NIL.

(*fread-byte* *stream* [*eof-err<sub>T</sub> [eof-val<sub>NIL</sub>]*])  
 ▷ Read next byte from binary *stream*.

(*fread-line* [*stream<sub>v\*standard-input\*</sub> [eof-err<sub>T</sub> [eof-val<sub>NIL</sub> [recursive<sub>NIL</sub>]]]*])  
 ▷ Return a line of text from *stream* and T if line has been ended by end of file.

- (*fread-sequence sequence stream* [:start *start*][:end *end*<sub>NIL</sub>])  
 ▷ Replace elements of *sequence* between *start* and *end* with elements from binary or character *stream*. Return index of *sequence*'s first unmodified element.
- (*freadtable-case readable*)<sub>UPCASE</sub>  
 ▷ Case sensitivity attribute (one of :upcase, :downcase, :preserve, :invert) of *readable*. **setfable**.
- (*fcopy-readtable [from-readtable*<sub>V\*READTABLE\*</sub> [*to-readtable*<sub>NIL</sub>]])  
 ▷ Return copy of *from-readtable*.
- (*fset-syntax-from-char to-char from-char* [*to-readtable*<sub>V\*READTABLE\*</sub>]  
 [*from-readtable*<sub>STANDARD READTABLE</sub>]])  
 ▷ Copy syntax of *from-char* to *to-readtable*. Return T.
- v\*READTABLE\*** ▷ Current readable.
- v\*READ-BASE\***<sub>10</sub> ▷ Radix for reading **integers** and **ratios**.
- v\*READ-DEFAULT-FLOAT-FORMAT\***<sub>SINGLE-FLOAT</sub>  
 ▷ Floating point format to use when not indicated in the number read.
- v\*READ-SUPPRESS\***<sub>NIL</sub>  
 ▷ If T, reader is syntactically more tolerant.
- (*fset-macro-character char function* [*non-term-p*<sub>NIL</sub> [*rt*<sub>V\*READTABLE\*</sub>]])  
 ▷ Make *char* a macro character associated with *function* of stream and *char*. Return T.
- (*fget-macro-character char* [*rt*<sub>V\*READTABLE\*</sub>])  
 ▷ Reader macro function associated with *char*, and T if *char* is a non-terminating macro character.
- (*fmake-dispatch-macro-character char* [*non-term-p*<sub>NIL</sub>  
 [*rt*<sub>V\*READTABLE\*</sub>]])  
 ▷ Make *char* a dispatching macro character. Return T.
- (*fset-dispatch-macro-character char sub-char function*  
 [*rt*<sub>V\*READTABLE\*</sub>])  
 ▷ Make *function* of stream, *n*, *sub-char* a dispatch function of *char* followed by *n*, followed by *sub-char*. Return T.
- (*fget-dispatch-macro-character char sub-char* [*rt*<sub>V\*READTABLE\*</sub>])  
 ▷ Dispatch function associated with *char* followed by *sub-char*.
- 
- ### 13.3 Character Syntax
- 
- #| *multi-line-comment\** |#  
; *one-line-comment\**  
 ▷ Comments. There are stylistic conventions:
- ;;;; *title* ▷ Short title for a block of code.
  - ;;; *intro* ▷ Description before a block of code.
  - ;; *state* ▷ State of program or of following code.
  - ; *explanation* ▷ Regarding line on which it appears.
  - ; *continuation* ▷ Regarding line on which it appears.
- (*foo\**[ . *bar*<sub>NIL</sub>]) ▷ List of *foos* with the terminating cdr *bar*.
- " ▷ Begin and end of a string.
- '*foo* ▷ (*squote foo*); *foo* unevaluated.
- `([*foo*] [,*bar*] [,@*baz*] [,..*quux*] [*bing*])  
 ▷ Backquote. *squote foo* and *bing*; evaluate *bar* and splice the lists *baz* and *quux* into their elements. When nested, outermost commas inside the innermost backquote expression belong to this backquote.
- #\*c* ▷ (*fcharacter "c"*), the character *c*.
- #B*n*; #On; n.; #X*n*; #R*n*  
 ▷ Integer of radix 2, 8, 10, 16, or *r*;  $2 \leq r \leq 36$ .

$n/d$	▷ The ratio $\frac{n}{d}$ .
$\{[m].n[\{\mathbf{S} \mathbf{F} \mathbf{D} \mathbf{L} \mathbf{E}\}x_{\boxed{0}}]\}m.[.n]\}[\{\mathbf{S} \mathbf{F} \mathbf{D} \mathbf{L} \mathbf{E}\}x]$	▷ $m.n \cdot 10^x$ as <b>short-float</b> , <b>single-float</b> , <b>double-float</b> , <b>long-float</b> , or the type from <b>*read-default-float-format*</b> .
<b>#C(a b)</b>	▷ ( $f\mathbf{complex}\ a\ b$ ), the complex number $a + bi$ .
<b>#'foo</b>	▷ ( $s\mathbf{function}\ foo$ ); the function named <i>foo</i> .
<b>#nAsequence</b>	▷ <i>n</i> -dimensional array.
<b>#[n](foo*)</b>	▷ Vector of some (or <i>n</i> ) <i>foos</i> filled with last <i>foo</i> if necessary.
<b>#[n]*b*</b>	▷ Bit vector of some (or <i>n</i> ) <i>bs</i> filled with last <i>b</i> if necessary.
<b>#S(type {slot value}* )</b>	▷ Structure of <i>type</i> .
<b>#Pstring</b>	▷ A pathname.
<b>#:foo</b>	▷ Uninterned symbol <i>foo</i> .
<b>#.form</b>	▷ Read-time value of <i>form</i> .
<b>v*read-eval*□</b>	▷ If <b>NIL</b> , a <b>reader-error</b> is signalled at <b>#..</b> .
<b>#integer= foo</b>	▷ Give <i>foo</i> the label <i>integer</i> .
<b>#integer#</b>	▷ Object labelled <i>integer</i> .
<b>#&lt;</b>	▷ Have the reader signal <b>reader-error</b> .
<b>#+feature when-feature</b>	
<b>#-feature unless-feature</b>	▷ Means <i>when-feature</i> if <i>feature</i> is <b>T</b> ; means <i>unless-feature</i> if <i>feature</i> is <b>NIL</b> . <i>feature</i> is a symbol from <b>*features*</b> , or ( <b>{and</b>   <b>or</b> } <i>feature</i> *) <b>,</b> or ( <b>not</b> <i>feature</i> ).
<b>v*features*</b>	▷ List of symbols denoting implementation-dependent features.
<b> c* ; \c</b>	▷ Treat arbitrary character(s) <i>c</i> as alphabetic preserving case.
<hr/>	
<b>13.4 Printer</b>	
<b>({fprin1 fprint fpprint fprinc})</b>	<i>foo</i> [ $\widetilde{stream}_{v\mathbf{*standard-output*}}$ ])
	▷ Print <i>foo</i> to <i>stream</i> $f\mathbf{readably}$ , $f\mathbf{readably}$ between a newline and a space, $f\mathbf{readably}$ after a newline, or human-readably without any extra characters, respectively. <b>fprin1</b> , <b>fprint</b> and <b>fprinc</b> return <u><i>foo</i></u> .
<b>(fprin1-to-string foo)</b>	
<b>(fprinc-to-string foo)</b>	▷ Print <i>foo</i> to <u><i>string</i></u> $f\mathbf{readably}$ or human-readably, respectively.
<b>(gprint-object object stream)</b>	▷ Print <u><i>object</i></u> to <i>stream</i> . Called by the Lisp printer.
<b>(mprint-unreadable-object (foo stream {::type bool<sub>NIL</sub> ::identity bool<sub>NIL</sub>}) form*)</b>	
	▷ Enclosed in <b>#&lt;</b> and <b>&gt;</b> , print <i>foo</i> by means of <i>forms</i> to <i>stream</i> . Return <u><b>NIL</b></u> .
<b>(fterpri [stream<sub>v\mathbf{*standard-output*}</sub>])</b>	
	▷ Output a newline to <i>stream</i> . Return <u><b>NIL</b></u> .
<b>(fresh-line [stream<sub>v\mathbf{*standard-output*}</sub>])</b>	
	▷ Output a newline to <i>stream</i> and return <u><b>T</b></u> unless <i>stream</i> is already at the start of a line.

(*fwrite-char* *char* [*stream*<sub>[*\*standard-output\**]</sub>])  
 ▷ Output *char* to *stream*.

(*{fwrite-string}*<sub>*{fwrite-line}*</sub> *string* [*stream*<sub>[*\*standard-output\**]</sub> [*{:start start<sub>0</sub>}*]  
*{:end end<sub>NIL</sub>}*]])  
 ▷ Write *string* to *stream* without/with a trailing newline.

(*fwrite-byte* *byte* *stream*) ▷ Write *byte* to binary *stream*.

(*fwrite-sequence* *sequence* *stream* *{:start start<sub>0</sub>}*  
*{:end end<sub>NIL</sub>}*)  
 ▷ Write elements of *sequence* to binary or character *stream*.

(*{fwrite}*<sub>*{fwrite-to-string}*</sub> *foo* {  
 :array *bool*  
 :base *radix*  
 :upcase  
 :case {  
 :downcase  
 :capitalize  
 :circle *bool*  
 :escape *bool*  
 :gensym *bool*  
 :length {*int*|*NIL*}  
 :level {*int*|*NIL*}  
 :lines {*int*|*NIL*}  
 :miser-width {*int*|*NIL*}  
 :pprint-dispatch *dispatch-table*  
 :pretty *bool*  
 :radix *bool*  
 :readably *bool*  
 :right-margin {*int*|*NIL*}  
 :stream *stream*<sub>[*\*standard-output\**]</sub>  
 })

▷ Print *foo* to *stream* and return *foo*, or print *foo* into *string*, respectively, after dynamically setting printer variables corresponding to keyword parameters (*\*print-bar\** becoming *:bar*). (*:stream* keyword with *fwrite* only.)

(*fpprint-fill* *stream* *foo* [*parenthesis<sub>0</sub>* [*noop*]])

(*fpprint-tabular* *stream* *foo* [*parenthesis<sub>0</sub>* [*noop* [*n<sub>16</sub>*]]])

(*fpprint-linear* *stream* *foo* [*parenthesis<sub>0</sub>* [*noop*]])

▷ Print *foo* to *stream*. If *foo* is a list, print as many elements per line as possible; do the same in a table with a column width of *n* ems; or print either all elements on one line or each on its own line, respectively. Return *NIL*. Usable with *fformat* directive *~//*.

(*mpprint-logical-block* (*stream* *list* {  
 {:prefix *string*  
 {:per-line-prefix *string*}}}  
 {:suffix *string<sub>0..n</sub>*})

(*declare* *decl<sub>\*</sub>*\*) *form<sup>P</sup>\**)

▷ Evaluate *forms*, which should print *list*, with *stream* locally bound to a pretty printing stream which outputs to the original *stream*. If *list* is in fact not a list, it is printed by *fwrite*. Return *NIL*.

(*mpprint-pop*)

▷ Take next element off *list*. If there is no remaining tail of *list*, or *\*print-length\** or *\*print-circle\** indicate printing should end, send element together with an appropriate indicator to *stream*.

(*fpprint-tab* {  
 :line  
 :line-relative  
 :section  
 :section-relative}} *c i* [*stream*<sub>[*\*standard-output\**]</sub>])

▷ Move cursor forward to column number *c + ki*, *k* ≥ 0 being as small as possible.

(*fpprint-indent* {  
 :block  
 :current}} *n* [*stream*<sub>[*\*standard-output\**]</sub>])

▷ Specify indentation for innermost logical block relative to leftmost position/to current position. Return *NIL*.

(*mpprint-exit-if-list-exhausted*)

▷ If *list* is empty, terminate logical block. Return *NIL* otherwise.

(*f***pprint-newline**  $\left\{ \begin{array}{l} \text{:linear} \\ \text{:fill} \\ \text{:miser} \\ \text{:mandatory} \end{array} \right\}$  [*stream* *v\*standard-output\**])  
▷ Print a conditional newline if *stream* is a pretty printing stream. Return NIL.

*v\*print-array\** ▷ If T, print arrays *f***readably**.

*v\*print-base\**<sub>10</sub> ▷ Radix for printing rationals, from 2 to 36.

*v\*print-case\**<sub>:upcase</sub> ▷ Print symbol names all uppercase (**:upcase**), all lowercase (**:downcase**), capitalized (**:capitalize**).

*v\*print-circle\**<sub>NIL</sub> ▷ If T, avoid indefinite recursion while printing circular structure.

*v\*print-escape\**<sub>T</sub> ▷ If NIL, do not print escape characters and package prefixes.

*v\*print-gensym\**<sub>T</sub> ▷ If T, print #: before uninterned symbols.

*v\*print-length\**<sub>NIL</sub>

*v\*print-level\**<sub>NIL</sub>

*v\*print-lines\**<sub>NIL</sub> ▷ If integer, restrict printing of objects to that number of elements per level/to that depth/to that number of lines.

*v\*print-miser-width\** ▷ If integer and greater than the width available for printing a substructure, switch to the more compact miser style.

*v\*print-pretty\** ▷ If T, print prettily.

*v\*print-radix\**<sub>NIL</sub> ▷ If T, print rationals with a radix indicator.

*v\*print-readably\**<sub>NIL</sub> ▷ If T, print *f***readably** or signal error **print-not-readable**.

*v\*print-right-margin\**<sub>NIL</sub> ▷ Right margin width in ems while pretty-printing.

(*f***set-pprint-dispatch** *type function* [*priority*<sub>0</sub> [*table*<sub>*v\*print-pprint-dispatch\**</sub>]])  
▷ Install entry comprising *function* of arguments *stream* and object to print; and *priority* as *type* into *table*. If *function* is NIL, remove *type* from *table*. Return NIL.

(*f***pprint-dispatch** *foo* [*table*<sub>*v\*print-pprint-dispatch\**</sub>]])  
▷ Return highest priority function associated with type of *foo* and T if there was a matching type specifier in *table*.

*2*

(*f***copy-pprint-dispatch** [*table*<sub>*v\*print-pprint-dispatch\**</sub>]])  
▷ Return copy of *table* or, if *table* is NIL, initial value of *v\*print-pprint-dispatch\**.

*v\*print-pprint-dispatch\** ▷ Current pretty print dispatch table.

---

## 13.5 Format

(*m***formatter**  $\widehat{\text{control}}$ )  
▷ Return function of *stream* and *arg\** applying *f***format** to *stream*, *control*, and *arg\** returning NIL or any excess *args*.

(*f***format** {T|NIL|*out-string*|*out-stream*} *control arg\**)  
▷ Output string *control* which may contain ~ directives possibly taking some *args*. Alternatively, *control* can be a function returned by *m***formatter** which is then applied to *out-stream* and *arg\**. Output to *out-string*, *out-stream* or, if first argument is T, to *v\*standard-output\**. Return NIL. If first argument is NIL, return formatted output.

~ [min-col<sub>0</sub>] [, [col-inc<sub>0</sub>] [, [min-pad<sub>0</sub>] [, 'pad-char<sub>0</sub>]]]]

[:] [<sub>0</sub>] {A|S}

▷ **Aesthetic/Standard.** Print argument of any type for consumption by humans/by the reader, respectively. With :, print NIL as () rather than nil; with <sub>0</sub>, add pad-chars on the left rather than on the right.

~ [radix<sub>0</sub>] [, [width] [, ['pad-char<sub>0</sub>] [, ['comma-char<sub>0</sub>] [, comma-interval<sub>0</sub>]]]] [:] [<sub>0</sub>] R

▷ **Radix.** (With one or more prefix arguments.) Print argument as number; with :, group digits comma-interval each; with <sub>0</sub>, always prepend a sign.

{~R|~:R|~@R|~@:R}

▷ **Roman.** Take argument as number and print it as English cardinal number, as English ordinal number, as Roman numeral, or as old Roman numeral, respectively.

~ [width] [, ['pad-char<sub>0</sub>] [, ['comma-char<sub>0</sub>] [, comma-interval<sub>0</sub>]]]] [:] [<sub>0</sub>] {D|B|O|X}

▷ **Decimal/Binary/Octal/Hexadecimal.** Print integer argument as number. With :, group digits comma-interval each; with <sub>0</sub>, always prepend a sign.

~ [width] [, [dec-digits] [, [shift<sub>0</sub>] [, ['overflow-char] [, 'pad-char<sub>0</sub>]]]] [:] [<sub>0</sub>] F

▷ **Fixed-Format Floating-Point.** With <sub>0</sub>, always prepend a sign.

~ [width] [, [dec-digits] [, [exp-digits] [, [scale-factor<sub>0</sub>] [, ['overflow-char] [, 'pad-char<sub>0</sub>] [, 'exp-char]]]]]] [:] [<sub>0</sub>] {E|G}

▷ **Exponential/General Floating-Point.** Print argument as floating-point number with dec-digits after decimal point and exp-digits in the signed exponent. With ~G, choose either ~E or ~F. With <sub>0</sub>, always prepend a sign.

~ [dec-digits<sub>0</sub>] [, [int-digits<sub>1</sub>] [, [width<sub>0</sub>] [, 'pad-char<sub>0</sub>]]]] [:] [<sub>0</sub>] \$

▷ **Monetary Floating-Point.** Print argument as fixed-format floating-point number. With :, put sign before any padding; with <sub>0</sub>, always prepend a sign.

{~C|~:C|~@C|~@:C}

▷ **Character.** Print, spell out, print in #\ syntax, or tell how to type, respectively, argument as (possibly non-printing) character.

{~(~( text ~)|~:( text ~)|~@(~( text ~)|~@:( text ~))}

▷ **Case-Conversion.** Convert text to lowercase, convert first letter of each word to uppercase, capitalize first word and convert the rest to lowercase, or convert to uppercase, respectively.

{~P|~:P|~@P|~@:P}

▷ **Plural.** If argument **eql** 1 print nothing, otherwise print s; do the same for the previous argument; if argument **eql** 1 print y, otherwise print yes; do the same for the previous argument, respectively.

~ [n<sub>0</sub>] % ▷ **Newline.** Print n newlines.

~ [n<sub>0</sub>] &

▷ **Fresh-Line.** Print n - 1 newlines if output stream is at the beginning of a line, or n newlines otherwise.

{~-|~:-|~@\_|~@:\_}

▷ **Conditional Newline.** Print a newline like **pprint-newline** with argument :linear, :fill, :miser, or :mandatory, respectively.

{~:↔|~@↔|~↔}

▷ **Ignored Newline.** Ignore newline, or whitespace following newline, or both, respectively.

~ [n<sub>0</sub>] | ▷ **Page.** Print n page separators.

~ [n<sub>0</sub>] ~ ▷ **Tilde.** Print n tildes.

~ [min-col<sub>0</sub>] [, [col-inc<sub>0</sub>] [, [min-pad<sub>0</sub>] [, 'pad-char<sub>0</sub>]]]]

[:] [<sub>0</sub>] < [nl-text ~[spare<sub>0</sub> [, width]:;] {text ~;}\* text ~>

▷ **Justification.** Justify text produced by texts in a field of at least min-col columns. With :, right justify; with <sub>0</sub>, left justify. If this would leave less than spare characters on the current line, output nl-text first.

{~ [::] [@@] < { [prefix<sub>1..n</sub> ~;] | [per-line-prefix ~@;] } body [~; suffix<sub>1..n</sub>] ~: [@@] >

▷ **Logical Block.** Act like **pprint-logical-block** using *body* as *fformat* control string on the elements of the list argument or, with **@@**, on the remaining arguments, which are extracted by **pprint-pop**. With **:**, *prefix* and *suffix* default to ( and ). When closed by **~@:>**, spaces in *body* are replaced with conditional newlines.

{~ [n<sub>0..n</sub>] i | ~ [n<sub>0..n</sub>] :i}

▷ **Indent.** Set indentation to *n* relative to leftmost/to current position.

{~ [c<sub>0..n</sub>] [,i<sub>1..n</sub>] [:] [@@] T

▷ **Tabulate.** Move cursor forward to column number  $c + ki$ ,  $k \geq 0$  being as small as possible. With **:**, calculate column numbers relative to the immediately enclosing section. With **@@**, move to column number  $c_0 + c + ki$  where  $c_0$  is the current position.

{~ [m<sub>0..n</sub>] \* | ~ [m<sub>0..n</sub>] :\* | ~ [n<sub>0..n</sub>] @@\*}

▷ **Go-To.** Jump *m* arguments forward, or backward, or to argument *n*.

{~ [limit] [:] [@@] { text ~ }

▷ **Iteration.** Use *text* repeatedly, up to *limit*, as control string for the elements of the list argument or (with **@@**) for the remaining arguments. With **:** or **@@:**, list elements or remaining arguments should be lists of which a new one is used at each iteration step.

{~ [x [,y [,z]]] ^

▷ **Escape Upward.** Leave immediately **~< ~>**, **~< ~:>**, **~{ ~}**, **~?**, or the entire *fformat* operation. With one to three prefixes, act only if  $x = 0$ ,  $x = y$ , or  $x \leq y \leq z$ , respectively.

{~ [i] [:] [@@] [ [{text ~;}\* text] [~::; default] ~ ]

▷ **Conditional Expression.** Use the zero-indexed argument (or *i*th if given) *text* as a *fformat* control subclause. With **:**, use the first *text* if the argument value is NIL, or the second *text* if it is T. With **@@**, do nothing for an argument value of NIL. Use the only *text* and leave the argument to be read again if it is T.

{~ ? | ~@? }

▷ **Recursive Processing.** Process two arguments as control string and argument list, or take one argument as control string and use then the rest of the original arguments.

{~ [prefix {,prefix}\*] [:] [@@] / [package [:]:<sub>cl-user</sub>] function/}

▷ **Call Function.** Call all-uppercase *package::function* with the arguments stream, format-argument, colon-p, at-sign-p and *prefixes* for printing format-argument.

{~ [:] [@@] W

▷ **Write.** Print argument of any type obeying every printer control variable. With **:**, pretty-print. With **@@**, print without limits on length or depth.

{V|#}

▷ In place of the comma-separated prefix parameters: use next argument or number of remaining unprocessed arguments, respectively.

## 13.6 Streams

```
(fopen path
      (:direction (:input :output :io :probe) :input)
      (:element-type (:type :default) character)
      (:if-exists (:new-version :error :rename :rename-and-delete :overwrite :append :supersede NIL)
                   (:new-version if path specifies :newest; NIL otherwise))
      (:if-does-not-exist (:error :create) (NIL for :direction :probe; {:create} :error otherwise))
      (:external-format format :default))

▷ Open file-stream to path.
```

(fmake-concatenated-stream *input-stream\**)  
 (fmake-broadcast-stream *output-stream\**)  
 (fmake-two-way-stream *input-stream-part output-stream-part*)  
 (fmake-echo-stream *from-input-stream to-output-stream*)  
 (fmake-synonym-stream *variable-bound-to-stream*)

▷ Return stream of indicated type.

(fmake-string-input-stream *string* [*start* [ *end* NIL ]])  
 ▷ Return a string-stream supplying the characters from *string*.

(fmake-string-output-stream [(:element-type *type* character)])  
 ▷ Return a string-stream accepting characters (available via fget-output-stream-string).

(fconcatenated-stream-streams *concatenated-stream*)  
 (fbroadcast-stream-streams *broadcast-stream*)  
 ▷ Return list of streams *concatenated-stream* still has to read from *broadcast-stream* is broadcasting to.

(ftwo-way-stream-input-stream *two-way-stream*)  
 (ftwo-way-stream-output-stream *two-way-stream*)  
 (fecho-stream-input-stream *echo-stream*)  
 (fecho-stream-output-stream *echo-stream*)  
 ▷ Return source stream or sink stream of *two-way-stream* / *echo-stream*, respectively.

(fsynonym-stream-symbol *synonym-stream*)  
 ▷ Return symbol of *synonym-stream*.

(fget-output-stream-string *string-stream*)  
 ▷ Clear and return as a string characters on *string-stream*.

(ffile-position *stream* [ (:start :end) position ])  
 ▷ Return position within stream, or set it to position and return T on success.

(ffile-string-length *stream foo*)  
 ▷ Length *foo* would have in *stream*.

(flisten [*stream* \*standard-input\*])  
 ▷ T if there is a character in input *stream*.

(fclear-input [*stream* \*standard-input\*])  
 ▷ Clear input from *stream*, return NIL.

({fclear-output  
fforce-output  
ffinish-output} [*stream* \*standard-output\*])  
 ▷ End output to *stream* and return NIL immediately, after initiating flushing of buffers, or after flushing of buffers, respectively.

(*fclose* *stream* [*:abort* *bool*<sub>NIL</sub>])  
▷ Close *stream*. Return *T* if *stream* had been open. If *:abort* is *T*, delete associated file.

(*mwith-open-file* (*stream path open-arg\**) (*declare decl\**)<sup>\*</sup> *form*<sup>P\*</sup>)  
▷ Use *fopen* with *open-args* to temporarily create *stream* to *path*; return values of forms.

(*mwith-open-stream* (*foo stream*) (*declare decl\**)<sup>\*</sup> *form*<sup>P\*</sup>)  
▷ Evaluate *forms* with *foo* locally bound to *stream*. Return values of forms.

(*mwith-input-from-string* (*foo string* {*:index index*  
*:start start*<sub>0</sub>  
*:end end*<sub>NIL</sub>}) (*declare decl\**)<sup>\*</sup> *form*<sup>P\*</sup>)  
▷ Evaluate *forms* with *foo* locally bound to input **string-stream** from *string*. Return values of forms; store next reading position into *index*.

(*mwith-output-to-string* (*foo* [*string*<sub>NIL</sub> [*:element-type type*<sub>character</sub>]])  
(*declare decl\**)<sup>\*</sup> *form*<sup>P\*</sup>)  
▷ Evaluate *forms* with *foo* locally bound to an output **string-stream**. Append output to *string* and return values of forms if *string* is given. Return *string* containing output otherwise.

(*fstream-external-format* *stream*)  
▷ External file format designator.

*v\*terminal-io\** ▷ Bidirectional stream to user terminal.

*v\*standard-input\**  
*v\*standard-output\**  
*v\*error-output\**  
▷ Standard input stream, standard output stream, or standard error output stream, respectively.

*v\*debug-io\**  
*v\*query-io\**  
▷ Bidirectional streams for debugging and user interaction.

## 13.7 Pathnames and Files

---

(*fmake-pathname*  
{*:host* {*host*|*NIL*|*:unspecific*}  
*:device* {*device*|*NIL*|*:unspecific*}  
*:directory* {*directory*|*wild*|*NIL*|*:unspecific*}  
{*:absolute*  
*:relative*} {*directory*  
*wild*  
*wild-inferiors*}  
*:name* {*file-name*|*wild*|*NIL*|*:unspecific*}  
*:type* {*file-type*|*wild*|*NIL*|*:unspecific*}  
*:version* {*:newest*|*version*|*wild*|*NIL*|*:unspecific*}  
*:defaults* *path*<sub>host from *v\*default-pathname-defaults\**</sub>  
*:case* {*:local*|*:common*}:*local*  
} )  
▷ Construct a logical pathname if there is a logical pathname translation for *host*, otherwise construct a physical pathname. For *:case :local*, leave case of components unchanged. For *:case :common*, leave mixed-case components unchanged; convert all-uppercase components into local customary case; do the opposite with all-lowercase components.

(*{fpathname-host fpathname-device fpathname-directory fpathname-name fpathname-type}* *path-or-stream* [*:case* {*:local*  
*:common*}:*local*])

(*fpathname-version* *path-or-stream*)  
▷ Return pathname component.

(*fparse-namestring* *foo* [*host*  
 [default-pathname<sub>v\*default-pathname-defaults\*</sub>  
 {  
 {  
 :start *start*<sub>0</sub>  
 :end *end*<sub>NIL</sub>  
 :junk-allowed *bool*<sub>NIL</sub>  
 }]]))  
 ▷ Return pathname converted from string, pathname, or stream *foo*; and position where parsing stopped.

(*fmerge-pathnames* *path-or-stream*  
 [default-path-or-stream<sub>v\*default-pathname-defaults\*</sub>  
 [default-version<sub>newest</sub>]])  
 ▷ Return pathname made by filling in components missing in *path-or-stream* from *default-path-or-stream*.

**v\*default-pathname-defaults\***  
 ▷ Pathname to use if one is needed and none supplied.

(*fuser-homedir-pathname* [*host*]) ▷ User's home directory.

(*fenough-namestring* *path-or-stream*  
 [root-path<sub>v\*default-pathname-defaults\*</sub>])  
 ▷ Return minimal path string that sufficiently describes the path of *path-or-stream* relative to *root-path*.

(*fnamestring* *path-or-stream*)  
 (*ffile-namestring* *path-or-stream*)  
 (*fdirectory-namestring* *path-or-stream*)  
 (*fhost-namestring* *path-or-stream*)  
 ▷ Return string representing full pathname; name, type, and version; directory name; or host name, respectively, of *path-or-stream*.

(*ftranslate-pathname* *path-or-stream* *wildcard-path-a*  
*wildcard-path-b*)  
 ▷ Translate the path of *path-or-stream* from *wildcard-path-a* into *wildcard-path-b*. Return new path.

(*fpathname* *path-or-stream*) ▷ Pathname of *path-or-stream*.

(*flogical-pathname* *logical-path-or-stream*)  
 ▷ Logical pathname of *logical-path-or-stream*. Logical pathnames are represented as all-uppercase "[*host*:][;]{*dir*\*}+";\*{*name*\*}\*[.{*type*\*}+][.{*version*\*|newest|NEWEST}].

(*flogical-pathname-translations* *logical-host*)  
 ▷ List of (*from-wildcard to-wildcard*) translations for *logical-host*. **setfable**.

(*fload-logical-pathname-translations* *logical-host*)  
 ▷ Load *logical-host*'s translations. Return NIL if already loaded; return T if successful.

(*ftranslate-logical-pathname* *path-or-stream*)  
 ▷ Physical pathname corresponding to (possibly logical) pathname of *path-or-stream*.

(*fprobe-file* *file*)  
 (*ftruename* *file*)  
 ▷ Canonical name of *file*. If *file* does not exist, return NIL/signal **file-error**, respectively.

(*ffile-write-date* *file*) ▷ Time at which *file* was last written.

(*ffile-author* *file*) ▷ Return name of file owner.

(*ffile-length* *stream*) ▷ Return length of stream.

(*frename-file* *foo* *bar*)  
 ▷ Rename file *foo* to *bar*. Unspecified components of path *bar* default to those of *foo*. Return new pathname, old physical file name, and new physical file name.  
<sub>3</sub>

(*fdelete-file* *file*) ▷ Delete *file*. Return T.

(*fdirectory* *path*) ▷ List of pathnames matching *path*.

(*fensure-directories-exist* *path* [:verbose *bool*])  
 ▷ Create parts of *path* if necessary. Second return value is T if something has been created.

## 14 Packages and Symbols

The Loop Facility provides additional means of symbol handling; see **loop**, page 21.

### 14.1 Predicates

(*fsymbolp* *foo*)  
 (*fpackagep* *foo*)      ▷ T if *foo* is of indicated type.  
 (*fkeywordp* *foo*)

### 14.2 Packages

:*bar* | **keyword**:*bar*      ▷ Keyword, evaluates to :bar.  
*package*:*symbol*      ▷ Exported *symbol* of *package*.  
*package*::*symbol*      ▷ Possibly unexported *symbol* of *package*.

(*mdefpackage* *foo* {  
 (:nicknames *nick*\* )  
 (:documentation *string*)  
 (:intern *interned-symbol*\* )  
 (:use *used-package*\* )  
 (:import-from *pkg* *imported-symbol*\* )  
 (:shadowing-import-from *pkg* *shd-symbol*\* )  
 (:shadow *shd-symbol*\* )  
 (:export *exported-symbol*\* )  
 (:size *int*) } )  
 ▷ Create or modify package foo with *interned-symbols*, symbols from *used-packages*, *imported-symbols*, and *shd-symbols*. Add *shd-symbols* to *foo*'s shadowing list.

(*fmake-package* *foo* {  
 (:nicknames (*nick*\* ))  
 (:use (*used-package*\* )) } )  
 ▷ Create package foo.

(*frename-package* *package* *new-name* [*new-nicknames*])  
 ▷ Rename *package*. Return renamed package.

(*min-package* *foo*)      ▷ Make package foo current.

{  
 (*fuse-package*)  
 (*funuse-package*) } *other-packages* [*package*]  
 ▷ Make exported symbols of *other-packages* available in *package*, or remove them from *package*, respectively. Return T.

(*fpackage-use-list* *package*)  
 (*fpackage-used-by-list* *package*)  
 ▷ List of other packages used by/using package.

(*fdelete-package* *package*)  
 ▷ Delete *package*. Return T if successful.

*v\*package\** [common-lisp-user]      ▷ The current package.

(*flist-all-packages*)      ▷ List of registered packages.

(*fpackage-name* *package*)      ▷ Name of package.

(*fpackage-nicknames* *package*)      ▷ Nicknames of package.

(*ffind-package* *name*)      ▷ Package with name (case-sensitive).

(*ffind-all-symbols* *foo*)  
 ▷ List of symbols foo from all registered packages.

{  
 (*fintern*)  
 (*ffind-symbol*) } *foo* [*package*]  
 ▷ Intern or find, respectively, symbol *foo* in *package*. Second return value is one of :internal, :external, or :inherited (or NIL if *fintern* has created a fresh symbol).

(*funintern* *symbol* [*package*])  
 ▷ Remove *symbol* from *package*, return T on success.

( $\{f\text{import}$   
 $\{f\text{shadowing-import}\}$ ) *symbols* [*package*<sub>v\*package\*</sub>])

▷ Make *symbols* internal to *package*. Return T. In case of a name conflict signal correctable **package-error** or shadow the old symbol, respectively.

( $f\text{shadow}$  *symbols* [*package*<sub>v\*package\*</sub>]))

▷ Make *symbols* of *package* shadow any otherwise accessible, equally named symbols from other packages. Return T.

( $f\text{package-shadowing-symbols}$  *package*)

▷ List of symbols of *package* that shadow any otherwise accessible, equally named symbols from other packages.

( $f\text{export}$  *symbols* [*package*<sub>v\*package\*</sub>]))

▷ Make *symbols* external to *package*. Return T.

( $f\text{unexport}$  *symbols* [*package*<sub>v\*package\*</sub>]))

▷ Revert *symbols* to internal status. Return T.

( $\{m\text{do-symbols}$   
 $\{m\text{do-external-symbols}$   
 $\{m\text{do-all-symbols}$  (*var* [*result*<sub>NIL</sub>])  
(*declare*  $\widehat{\text{decl}}^*$ ) $^*$   $\{\{\widehat{\text{tag}}$   
 $\{\text{form}\}^*\})$

▷ Evaluate **stagbody**-like body with *var* successively bound to every symbol from *package*, to every external symbol from *package*, or to every symbol from all registered packages, respectively. Return values of result. Implicitly, the whole form is a **sblock** named NIL.

( $m\text{with-package-iterator}$  (*foo* *packages* [:**internal**|:**external**|:**inherited**]))

(*declare*  $\widehat{\text{decl}}^*$ ) $^*$  *form*<sup>P</sup> $^*$ )

▷ Return values of forms. In *forms*, successive invocations of (*foo*) return: T if a symbol is returned; a symbol from *packages*; accessibility (**:internal**, **:external**, or **:inherited**); and the package the symbol belongs to.

( $f\text{require}$  *module* [*paths*<sub>NIL</sub>]))

▷ If not in **v\*modules\***, try *paths* to load *module* from. Signal **error** if unsuccessful. Deprecated.

( $f\text{provide}$  *module*)

▷ If not already there, add *module* to **v\*modules\***. Deprecated.

**v\*modules\***

▷ List of names of loaded modules.

## 14.3 Symbols

A **symbol** has the attributes *name*, home **package**, property list, and optionally value (of global constant or variable *name*) and function (**function**, macro, or special operator *name*).

( $f\text{make-symbol}$  *name*)

▷ Make fresh, uninterned symbol *name*.

( $f\text{gensym}$  [*sp*])

▷ Return fresh, uninterned symbol **#:sn** with *n* from **v\*gensym-counter\***. Increment **v\*gensym-counter\***.

( $f\text{gentemp}$  [*prefix*<sub>□</sub> [*package*<sub>v\*package\*</sub>]])

▷ Intern fresh symbol in *package*. Deprecated.

( $f\text{copy-symbol}$  *symbol* [*props*<sub>NIL</sub>]))

▷ Return uninterned copy of *symbol*. If *props* is T, give copy the same value, function and property list.

( $f\text{symbol-name}$  *symbol*)

( $f\text{symbol-package}$  *symbol*)

▷ Name or package, respectively, of *symbol*.

( $f\text{symbol-plist}$  *symbol*)

( $f\text{symbol-value}$  *symbol*)

( $f\text{symbol-function}$  *symbol*)

▷ Property list, value, or function, respectively, of *symbol*. **setfable**.

( $\left\{ \begin{array}{l} g\text{documentation} \\ (\text{setf } g\text{documentation}) \text{ new-doc} \end{array} \right\} \text{ foo}$   $\left\{ \begin{array}{l} \text{'variable|'function} \\ \text{'compiler-macro} \\ \text{'method-combination} \\ \text{'structure|'type|'setf|T} \end{array} \right\}$ )

▷ Get/set documentation string of *foo* of given type.

**c****t**

▷ Truth; the supertype of every type including **t**; the superclass of every class except **t**; **\*terminal-io\***.

**cnil|c()**

▷ Falsity; the empty list; the empty type, subtype of every type; **\*standard-input\***; **\*standard-output\***; the global environment.

## 14.4 Standard Packages

---

**common-lisp|cl**

▷ Exports the defined names of Common Lisp except for those in the **keyword** package.

**common-lisp-user|cl-user**

▷ Current package after startup; uses package **common-lisp**.

**keyword**

▷ Contains symbols which are defined to be of type **keyword**.

# 15 Compiler

---

## 15.1 Predicates

---

(**fspecial-operator-p** *foo*) ▷ T if *foo* is a special operator.

(**fcompiled-function-p** *foo*)

▷ T if *foo* is of type **compiled-function**.

## 15.2 Compilation

---

(**fcompile**  $\left\{ \begin{array}{l} \text{NIL definition} \\ \left\{ \begin{array}{l} \text{name} \\ (\text{setf name}) \end{array} \right\} [\text{definition}] \end{array} \right\}$ )

▷ Return compiled function or replace *name*'s function definition with the compiled function. Return T in case of **warnings** or **errors**, and T in case of **warnings** or **errors** excluding **style-warnings**.

(**fcompile-file** *file*  $\left\{ \begin{array}{l} :\text{output-file } \text{out-path} \\ :\text{verbose } \text{bool } \boxed{\text{*compile-verbose*}} \\ :\text{print } \text{bool } \boxed{\text{*compile-print*}} \\ :\text{external-format } \text{file-format } \boxed{\text{:default}} \end{array} \right\}$ )

▷ Write compiled contents of *file* to *out-path*. Return true output path or NIL, T in case of **warnings** or **errors**, T in case of **warnings** or **errors** excluding **style-warnings**.

(**fcompile-file-pathname** *file* [**:output-file** *path*] [**other-keyargs**])

▷ Pathname **fcompile-file** writes to if invoked with the same arguments.

(**fload** *path*  $\left\{ \begin{array}{l} :\text{verbose } \text{bool } \boxed{\text{*load-verbose*}} \\ :\text{print } \text{bool } \boxed{\text{*load-print*}} \\ :\text{if-does-not-exist } \text{bool } \boxed{\text{T}} \\ :\text{external-format } \text{file-format } \boxed{\text{:default}} \end{array} \right\}$ )

▷ Load source file or compiled file into Lisp environment. Return T if successful.

**\*compile-file**  
**\*load**  $\left\{ \begin{array}{l} :\text{pathname* } \boxed{\text{NIL}} \\ :\text{truename* } \boxed{\text{NIL}} \end{array} \right\}$

▷ Input file used by **fcompile-file**/by **fload**.

**\*compile**  
**\*load**  $\left\{ \begin{array}{l} :\text{print*} \\ :\text{verbose*} \end{array} \right\}$

▷ Defaults used by **fcompile-file**/by **fload**.

<b>(<i>s</i>eval-when (<math>\left\{ \begin{array}{ l} \hline :compile-toplevel   compile \\ :load-toplevel   load \\ :execute   eval \\ \end{array} \right\}</math>) <i>form</i><sup>P*</sup>)</b>	▷ Return <u>values of forms</u> if <b>s</b> eval-when is in the top-level of a file being compiled, in the top-level of a compiled file being loaded, or anywhere, respectively. Return <u>NIL</u> if <i>forms</i> are not evaluated. ( <b>compile</b> , <b>load</b> and <b>eval</b> deprecated.)
<b>(<i>s</i>locally (<b>declare</b> <i>decl</i>*)) <i>form</i><sup>P*</sup>)</b>	▷ Evaluate <i>forms</i> in a lexical environment with declarations <i>decl</i> in effect. Return <u>values of forms</u> .
<b>(<i>m</i>with-compilation-unit ([<b>:override</b> <i>bool</i><u>NIL</u>]) <i>form</i><sup>P*</sup>)</b>	▷ Return <u>values of forms</u> . Warnings deferred by the compiler until end of compilation are deferred until the end of evaluation of <i>forms</i> .
<b>(<i>s</i>load-time-value <i>form</i> [<u>read-only</u><u>NIL</u>])</b>	▷ Evaluate <i>form</i> at compile time and treat <u>its value</u> as literal at run time.
<b>(<i>s</i>quote <i>foo</i>)</b>	▷ Return <u>unevaluated foo</u> .
<b>(<i>g</i>make-load-form <i>foo</i> [<i>environment</i>])</b>	▷ Its methods are to return a <u>creation form</u> which on evaluation at <b>fload</b> time returns an object equivalent to <i>foo</i> , and an optional <u>initialization form</u> which on evaluation performs some initialization of the object.
<b>(<i>f</i>make-load-form-saving-slots <i>foo</i> {<b>:slot-names</b> <i>slots</i><u>all local slots</u> <b>:environment</b> <i>environment</i>})</b>	▷ Return a <u>creation form</u> and an <u>initialization form</u> which on evaluation construct an object equivalent to <i>foo</i> with <i>slots</i> initialized with the corresponding values from <i>foo</i> .
<b>(<i>f</i>macro-function <i>symbol</i> [<i>environment</i>])</b>	
<b>(<i>f</i>compiler-macro-function {<b>name</b> (<b>setf</b> <i>name</i>)} [<i>environment</i>])</b>	▷ Return specified <u>macro function</u> , or <u>compiler macro function</u> , respectively, if any. Return <u>NIL</u> otherwise. <b>setfable</b> .
<b>(<i>f</i>eval <i>arg</i>)</b>	▷ Return <u>values of value of arg</u> evaluated in global environment.
<b>15.3 REPL and Debugging</b>	
<b>v+   v++   v+++</b>	
<b>v*   v**   v***</b>	
<b>v/   v//   v///</b>	▷ Last, penultimate, or antepenultimate <u>form</u> evaluated in the REPL, or their respective <u>primary value</u> , or a <u>list</u> of their respective values.
<b>v-</b>	▷ <u>Form</u> currently being evaluated by the REPL.
<b>(<i>f</i>apropos <i>string</i> [<i>package</i><u>NIL</u>])</b>	▷ Print interned symbols containing <i>string</i> .
<b>(<i>f</i>apropos-list <i>string</i> [<i>package</i><u>NIL</u>])</b>	▷ <u>List of interned symbols</u> containing <i>string</i> .
<b>(<i>f</i>dribble [<i>path</i>])</b>	▷ Save a record of interactive session to file at <i>path</i> . Without <i>path</i> , close that file.
<b>(<i>f</i>ed [<i>file-or-function</i><u>NIL</u>])</b>	▷ Invoke editor if possible.
<b>({<b>f</b>macroexpand-1} {<b>f</b>macroexpand} <i>form</i> [<i>environment</i><u>NIL</u>])</b>	▷ Return <u>macro expansion</u> , once or entirely, respectively, of <i>form</i> and <u>T</u> if <i>form</i> was a macro form. Return <u>form</u> and <u>NIL</u> otherwise.
<b>v*macroexpand-hook*</b>	▷ Function of arguments expansion function, macro form, and environment called by <b>fmacroexpand-1</b> to generate macro expansions.

(*mtrace* {*function*  
  {*(setf function)*}  
})  
▷ Cause *functions* to be traced. With no arguments, return list of traced functions.

(*muntrace* {*function*  
  {*(setf function)*}  
})  
▷ Stop *functions*, or each currently traced function, from being traced.

#### **\*trace-output\***

▷ Output stream *mtrace* and *mtime* send their output to.

#### (*mstep* *form*)

▷ Step through evaluation of *form*. Return values of *form*.

#### (*fbreak* [*control arg*\*])

▷ Jump directly into debugger; return NIL. See page 36, *fformat*, for *control* and *args*.

#### (*mtime* *form*)

▷ Evaluate *forms* and print timing information to **\*trace-output\***. Return values of *form*.

#### (*finspect* *foo*)

▷ Interactively give information about *foo*.

#### (*fdescribe* *foo* [*stream*   **\*standard-output\***])

▷ Send information about *foo* to *stream*.

#### (*gdescribe-object* *foo* [*stream*])

▷ Send information about *foo* to *stream*. Called by *fdescribe*.

#### (*fdisassemable* *function*)

▷ Send disassembled representation of *function* to **\*standard-output\***. Return NIL.

#### (*froom* [{*NIL*|**:default**|*T*}   **:default**])

▷ Print information about internal storage management to **\*standard-output\***.

## 15.4 Declarations

---

#### (*fproclaim* *decl*)

#### (*mdeclaim* *decl*\*))

▷ Globally make declaration(s) *decl*. *decl* can be: **declaration**, **type**, **ftype**, **inline**, **notinline**, **optimize**, or **special**. See below.

#### (*declare* *decl*\*))

▷ Inside certain forms, locally make declarations *decl*\*). *decl* can be: **dynamic-extent**, **type**, **ftype**, **ignorable**, **ignore**, **inline**, **notinline**, **optimize**, or **special**. See below.

#### (**declaration** *foo*\*))

▷ Make *foos* names of declarations.

#### (**dynamic-extent** *variable*\* (**function** *function*)\*))

▷ Declare lifetime of *variables* and/or *functions* to end when control leaves enclosing block.

#### ([**type**] *type* *variable*\*))

#### (**ftype** *type* *function*\*))

▷ Declare *variables* or *functions* to be of *type*.

#### ({**ignorable**} {*var*   {**ignore**} {(**function** *function*)}}\*)

▷ Suppress warnings about used/unused bindings.

#### (**inline** *function*\*))

#### (**notinline** *function*\*))

▷ Tell compiler to integrate/not to integrate, respectively, called *functions* into the calling routine.

#### (**optimize** {**compilation-speed**|(**compilation-speed** *n*)   {**debug**|(**debug** *n*)   {**safety**|(**safety** *n*)   {**space**|(**space** *n*)   {**speed**|(**speed** *n*)})})

▷ Tell compiler how to optimize. *n* = 0 means unimportant, *n* = 1 is neutral, *n* = 3 means important.

#### (**special** *var*\*))

▷ Declare *vars* to be dynamic.

## 16 External Environment

---

(*fget-internal-real-time*)

(*fget-internal-run-time*)

▷ Current time, or computing time, respectively, in clock ticks.

*cinternal-time-units-per-second*

▷ Number of clock ticks per second.

(*fencode-universal-time* *sec min hour date month year [zone<sub>CURRENT</sub>]*)

(*fget-universal-time*)

▷ Seconds from 1900-01-01, 00:00, ignoring leap seconds.

(*fdecode-universal-time* *universal-time [time-zone<sub>CURRENT</sub>]*)

(*fget-decoded-time*)

▷ Return second, minute, hour, date, month, year, day, daylight-p, and zone.

(*fshort-site-name*)

(*flong-site-name*)

▷ String representing physical location of computer.

( $\left\{ \begin{array}{l} f\text{lisp-implementation} \\ f\text{software} \\ f\text{machine} \end{array} \right\} - \left\{ \begin{array}{l} \text{type} \\ \text{version} \end{array} \right\}$ )

▷ Name or version of implementation, operating system, or hardware, respectively.

(*fmachine-instance*)      ▷ Computer name.
