## 10.3 Method Combination Types

standard

▷ Evaluate most specific **:around** method supplying the values of the generic function. From within this method, ***f*call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, call all **:before** methods, most specific first, and the most specific primary method which supplies the values of the calling ***f*call-next-method** if any, or of the generic function; and which can call less specific primary methods via ***f*call-next-method**. After its return, call all **:after** methods, least specific first.

and|or|append|list|nconc|progn|max|min|+

▷ Simple built-in **method-combination** types; have the same usage as the *c-types* defined by the short form of **mdefine-method-combination**.

(*m*define-method-combination *c-type*

{  
  :**documentation** *string*  
  :**identity-with-one-argument** *bool*<sub>NIL</sub>  
  :**operator** *operator*<sub>*c-type*</sub>  
})

▷ **Short Form.** Define new **method-combination** *c-type*. In a generic function using *c-type*, evaluate most specific **:around** method supplying the values of the generic function. From within this method, ***f*call-next-method** can call less specific **:around** methods if there are any. If not, or if there are no **:around** methods at all, return from the calling **call-next-method** or from the generic function, respectively, the values of (*operator* (*primary-method* *gen-arg*)\*)\*, *gen-arg*\* being the arguments of the generic function. The *primary-methods* are ordered {**:most-specific-first** | **:most-specific-last** | **:most-specific-first**} (specified as *c-arg* in **mdefgeneric**). Using *c-type* as the *qualifier* in **mdefmethod** makes the method primary.

(*m*define-method-combination *c-type* (*ord-λ*\*) ((*group*

      (**declare** *decl*)\*  
      *doc*  
    } *body*<sub>R</sub>  
  }

▷ **Long Form.** Define new **method-combination** *c-type*. A call to a generic function using *c-type* will be equivalent to a call to the forms returned by *body*\* with *ord-λ*\* bound to *c-arg*\* (cf. **mdefgeneric**), with *symbol* bound to the generic function, with *method-combination-λ*\* bound to the arguments of the generic function, and with *groups* bound to lists of methods. An applicable method becomes a member of the left-most *group* whose *predicate* or *qualifiers* match. Methods can be called via **mcall-method**. Lambda lists (*ord-λ*\*) and (*method-combination-λ*\*) according to *ord-λ* on page 18, the latter enhanced by an optional **&whole** argument.

(*m*call-method

## 15.4 Declarations

(*f*proclaim *decl*)

(*m*declaim *decl*\*)

▷ Globally make declaration(s) *decl*. *decl* can be: **declaration**, **type**, **ftype**, **inline**, **notinline**, **optimize**, or **special**. See below.

(declare *decl*\*)

▷ Inside certain forms, locally make declarations *decl*\*. *decl* can be: **dynamic-extent**, **type**, **ftype**, **ignorable**, **ignore**, **inline**, **notinline**, **optimize**, or **special**. See below.

(**declaration** foo\*) ▷ Make *foos* names of declarations.

(**dynamic-extent** *variable*\* (**function** *function*)\*)

▷ Declare lifetime of *variables* and/or *functions* to end when control leaves enclosing block.

([**type**] *type variable*\*)

(**ftype** *type function*\*)

▷ Declare *variables* or *functions* to be of *type*.

(**ignorable** {*var* (**function** *function*)\*})

▷ Suppress warnings about used/unused bindings.

(**inline** *function*\*)

(**notinline** *function*\*)

▷ Tell compiler to integrate/not to integrate, respectively, called *functions* into the calling routine.

(**optimize** {**compilation-speed**(**compilation-speed** *n*<sub>Ⓜ</sub>)  
**debug**(**debug** *n*<sub>Ⓜ</sub>)  
**safety**(**safety** *n*<sub>Ⓜ</sub>)  
**space**(**space** *n*<sub>Ⓜ</sub>)  
**speed**(**speed** *n*<sub>Ⓜ</sub>)

▷ Tell compiler how to optimize. *n* = 0 means unimportant, *n* = 1 is neutral, *n* = 3 means important.

(**special** *var*\*)

▷ Declare *vars* to be dynamic.

## 16 External Environment

(*f*get-internal-real-time)

(*f*get-internal-run-time)

▷ Current time, or computing time, respectively, in clock ticks.

**internal-time-units-per-second**

▷ Number of clock ticks per second.

(*f*encode-universal-time *sec min hour date month year* [*zone* *curr*])

(*f*get-universal-time)

▷ Seconds from 1900-01-01, 00:00, ignoring leap seconds.

(*f*decode-universal-time *universal-time* [*time-zone* *current*])

(*f*get-decoded-time)

▷ Return second, minute, hour, date, month, year, day, daylight-p, and zone.

(*f*short-site-name)

(*f*long-site-name)

▷ String representing physical location of computer.

{(*f*lisp-implementation)  
(*f*software)  
(*f*machine)} - {**type**  
**version**}

▷ Name or version of implementation, operating system, or hardware, respectively.

(*f*machine-instance) ▷ Computer name.
